Abstract. This paper is concerned with the proof of the existence and uniqueness of an entropy solution for Bürgers equation with additive source term (outside forces act on fluid particles). Some estimates are given.

Mathematics Subject Classification: Primary 35Q35, 35Q53; Secondary 35A05, 35A35

Keywords: Bürgers equation, existence and uniqueness theorems, approximation

1. Introduction

Conservation laws for nonlinear hyperbolic problems rise in applied science as fluid mechanics ([8], [12]), electrochemical engineering, semi-conductors theory,... Systems of hyperbolic equations are systems of partial differential equations which govern a large classes of applied problems among these last appear the most fundamental problems. For example, wave equations, Euler equations of gas dynamics ([8], [12])...

Several Studies ([1], [2], [10]) have been doing on the conservation law problems where outside forces are zeros (particles motion of uniform fluid).
Consider the following problem:

\[ \frac{\partial u}{\partial t} + \frac{1}{2} \frac{\partial (u^2)}{\partial x} = f(x, t) + \frac{\tau}{2} \frac{\partial^2 u}{\partial x^2} \]

It is well known that this problem admits an unique solution ([3], [5], [7]) \( u_\tau \in C^3([a, b[ \times ]0, T]) \). When \( \tau \to 0 \), we arrive to study the following Burgers equation:

\[ \frac{\partial u}{\partial t} + \frac{1}{2} \frac{\partial (u^2)}{\partial x} = f(x, t), \]

where \( u \) denotes velocity of particule and \( f \) is source function (outside force). This problem does not admit an unique solution. Beyond some critical time \( t_0 \), the classical solution does not exist. There exists at least a weak solution defined for the time \( t > t_0 \). Nevertheless, the class of weak solutions is very large to ensure the uniqueness solution. We will choose an entropy unique solution among all weak solutions.

This paper is concerned with the proof of the existence and uniqueness of an entropy solution for Burgers equation with additive source term (outside forces act on fluid particles). Some estimations are given.

2. Existence and Uniqueness of an Entropy Solution

We will prove the existence and uniqueness of an entropy solution of Burgers equation for \( x \in ]a, b[ \) and \( t > 0 \). Find \( u \) defined on \( ]a, b[ \times ]0, \infty[ \) and verified

\[
\begin{align*}
\frac{\partial u}{\partial t} + \frac{1}{2} \frac{\partial (u^2)}{\partial x} &= f(x, t), \quad (x, t) \in ]a, b[ \times ]0, \infty[ \\
\begin{cases}
 u(x, 0) = u_0(x), & x \in ]a, b[
 u(x, T) = u_T(x), & x \in ]a, b[
 u(a, t) = u_1(t), & t \in ]0, \infty[ \\
u(b, t) = u_2(t), & t \in ]0, \infty[ 
\end{cases}
\end{align*}
\]

(2.1)

Suppose

\[ f \in C^2([a, b[ \times ]0, \infty[ \cap L^1([a, b[ \times ]0, \infty[), \quad u_0 \in C^2([a, b[), \]

\[ u_1 \text{ and } u_2 \in C^2([0, \infty[ \cap L^\infty([0, \infty[), \quad u_1(0) = u_0(a) \quad \text{and} \quad u_2(0) = u_0(b). \]

To prove the existence theorem, we use a viscosity method ([1], [6]) based on the following equation:

\[ \frac{\partial u_\tau}{\partial t} + \frac{1}{2} \frac{\partial (u_\tau^2)}{\partial x} = f(x, t) + \frac{\tau}{2} \frac{\partial^2 u_\tau}{\partial x^2} \]

with \( \tau > 0 \), \( \tau \) tends to zero, and same initial and boundary data.
By an argument of compactness, we will obtain the convergence (in \(L^1\)) of an extract sequence \(\{u_{\tau_n}\}\). This last tends to a solution \(u\) of (2.1) as \(\tau_n \to 0\), and characterized by a particular formulation which assure the uniqueness of solution.

**Notations:**
- We will use the bounded variation functions space on an open set \(\Omega\), denoted \(BV(\Omega)\) ([11]) defined by
  \[
  u \in BV(\Omega) \Leftrightarrow \|u\| = \sup_{\phi \in \Lambda} \left( \int_{\Omega} u \text{div} \phi \, dx \right) < +\infty
  \]
  where
  \[
  \Lambda = \{ \phi \in D(\Omega) : |\phi|_\infty \leq 1 \}.
  \]
- We take \(\Omega = I\) in a space of dimension 1. We have
  \[
  u \in BV(\Omega) \Leftrightarrow \|u\| = \lim_{(\mu \to 0)} \frac{1}{\mu} \int_a^b |u(x + \mu) - u(x)| \, dx < +\infty.
  \]
  Denote \(\Delta(I)\) the set of discrete subdivisions of \(I\), namely the set of creasing finite sequences \(\{x_0 = a, x_1, ..., x_N = b\}\) . Then
  \[
  u \in BV(\Omega) \Leftrightarrow \|u\| = \sup_{\{x_i\} \in \Delta(I)} \left( \sum_{i=1}^N |u(x_{i+1}) - u(x_i)| \right) < +\infty.
  \]
- \(\|u\|\) is a semi norm on the space of \(BV(\Omega)\) called total variation of \(u\).
- \(BV(\Omega)\) is a Banach space in adding \(|u|_\infty\).
- Put \(\Omega = ]a, b[ \times ]0, T[\) , with \(T > 0\), we have
  \[
  W^{1,1}(]a, b[ \times ]0, T[) \subset BV(]a, b[ \times ]0, T[).
  \]
  For a space of dimension 1, we have
  \[
  BV(]a, b[) \subset L^\infty(]a, b[).
  \]
- A function \(u\) of \(BV(]a, b[)\) admits in any point a right and left limits.
- Let \(u \in BV(\Omega);\) for almost any \(t \in ]0, T[,\) \(u(., t) \in BV(]a, b[)\) and so admits left and right limits in all point. This enables to prove existence of traces at \(a\) and \(b\) (these points are achieved for a convergence almost every where) and thus in \(L^1(]0, T[)\) by dominated Lebesgue theorem of convergence.
- In the same way, for almost any \(x \in ]a, b[,\) \(u(t, .) \in BV(]0, T[)\) and admits left and right limits in all point. Then \(u\) admits a trace at \(t = 0\), achieved for a convergence almost every where and thus in \(L^1(]a, b[)\) as \(t \to 0\).

**Theorem 1.** ([1]) **(Riesz-Tamakin)** The injection of \(W^{1,1}(\Omega)\) in \(L^1(\Omega)\) is relatively compact.
Theorem 2. ([1], [10])(Helly) The injection of $BV(\Omega) \cap L^\infty(\Omega)$ in $L^1(\Omega)$ is relatively compact.

So, we will extract a convergent sequence in $L^1(\Omega)$ from all bounded family of $W^{1,1}(\Omega)$. Moreover, a limit of this sequence is an element of $BV(\Omega) \cap L^\infty(\Omega)$.

Lemma 3. ([9], [1])(Saks) Let $\Omega$ be an open set of $\mathbb{R}^n$, and $v \in C^1(\Omega)$. Then

$$\lim_{(\eta \to 0)} \int_{\{x : |x| < \eta \}} |\nabla v| \, dx = 0.$$ 

We introduce the sign function for $\eta > 0$, $z \in \mathbb{R}$, as

$$sg_\eta(z) = \begin{cases} 
1 & \text{if } z > \eta \\
\frac{z}{\eta} & \text{if } -\eta \leq z \leq \eta \\
-1 & \text{if } z < -\eta,
\end{cases}$$

moreover

$$\lim_{(\eta \to 0)} sg_\eta(z) = sg_0(z) = \begin{cases} 
1 & \text{if } z > \eta \\
0 & \text{if } z = 0 \\
-1 & \text{if } z < -\eta
\end{cases},$$

and a function $ab_\eta$ defined on $\mathbb{R}$ by

$$ab_\eta(x) = \int_0^x sg_\eta(x) \, dx$$

$$\frac{\partial ab_\eta(x)}{\partial x} = sg_\eta(x)$$

$$\frac{\partial ab_\eta(y(x))}{\partial x} = \frac{\partial ab_\eta(y(x))}{\partial y} \frac{\partial y}{\partial x} = \frac{\partial y}{\partial x} sg_\eta(y)$$

approaches the absolute value under limit

$$\lim_{(\eta \to 0)} ab_\eta(x) = ab_0(x) = |x|.$$ 

Theorem 4. The problem (2.1) admits an unique solution $u \in BV([a, b] \times ]0, T[) \cap L^\infty([a, b] \times ]0, T[)$ characterized by

$$\int_a^b \int_0^T (|u - k| \frac{\partial \varphi}{\partial t} + sg_0(u - k)((\frac{u^2 - k^2}{2})\frac{\partial \varphi}{\partial x} + f(x, t)\varphi)) \, dx \, dt + \int_a^b |u_0(x) - k| \varphi(x, 0) \, dx$$

$$\geq \int_0^T sg_0(u_2(t) - k)((\frac{u_2^2(t) - w_{\infty}(t)^2}{2})\varphi(b, t) \, dt - \int_0^T sg_0(u_1 - k)((\frac{u_1^2(t) - w_{\infty}(t)^2}{2})\varphi(a, t) \, dt.$$
Lemma 5. We have

\[ |u_\tau|_{L^\infty([a,b]\times [0,T])} \leq M_0 = \operatorname{Max}(|u_1|_{L^\infty([0,T])} ; |u_2|_{L^\infty([0,T])} ; |u_0|_{L^\infty([a,b])} ; |u_T|_{L^\infty([a,b])}). \]

Proof. If \( u_\tau \) appears as maximum at \((x_0, t_0) \in [a, b] \times [0, T]\), we will have in this point

\[ \frac{\partial u_\tau}{\partial x}(x_0, t_0) = 0, \quad \frac{\partial^2 u_\tau}{\partial x^2}(x_0, t_0) \leq 0 \]

then (by (2.2))

\[ \frac{\partial u_\tau}{\partial t}(x_0, t_0) \leq f(x_0, t_0) \]

a) If

\[ f(x_0, t_0) \leq 0 \Rightarrow \frac{\partial u_\tau}{\partial t}(x_0, t_0) \leq 0. \]

Such maximum does not appear therefore inside of \([a, b] \times [0, T]\). It appears therefore at \( x = a \), at \( x = b \) or at \( t = 0 \). Thus we have an estimate

(2.3) \[ |u_\tau|_{L^\infty([a,b]\times [0,T])} \leq \operatorname{Max}(|u_1|_{L^\infty([0,T])} ; |u_2|_{L^\infty([0,T])} ; |u_0|_{L^\infty([a,b])}) \]

b) If

\[ 0 \leq \frac{\partial u_\tau}{\partial t}(x_0, t_0) \leq f(x_0, t_0), \]

such maximum does not appear therefore inside of \([a, b] \times [0, T]\). It appears therefore at \( x = a \), at \( x = b \) or at \( t = T \). Thus we have an estimate

\[ |u_\tau|_{L^\infty([a,b]\times [0,T])} \leq \operatorname{Max}(|u_1|_{L^\infty([0,T])} ; |u_2|_{L^\infty([0,T])} ; |u_T|_{L^\infty([a,b])}) \]

In any case we have the following estimate:

\[ |u_\tau|_{L^\infty([a,b]\times [0,T])} \leq M_0 = \operatorname{Max}(|u_1|_{L^\infty([0,T])} ; |u_2|_{L^\infty([0,T])} ; |u_0|_{L^\infty([a,b])} ; |u_T|_{L^\infty([a,b])}). \]

3. Priori Estimates

Let \( \tau > 0 (\tau \to 0), T > 0 (T \to \infty) \). Consider the problem (2.2) with same initial and boundary conditions for \((x, t) \in [a, b] \times [0, T]\). We know such problem admits an unique solution \( u_\tau \in C^3([a,b] \times [0,T]). \)

Theorem 6. (estimate of \( \frac{\partial u_\tau}{\partial x} \) in \( L^1([a,b] \times [0,T]) \)) We have the following estimate:

\[ \left| \frac{\partial u_\tau(x, t)}{\partial x} \right|_{L^1([a,b])} \leq M_1(T). \]
Proof. For \( t \in ]0, T[ \) , \((t \text{ fixe})\), we derive (2.2) relate to \( x \), multiply by \( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \) and integrate on \([a, b[\). We obtain

\[
(3.1) \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial}{\partial x} \left( \frac{\partial u_x}{\partial t} + \frac{1}{2} \frac{\partial (u_x^2)}{\partial x} \right) \right) dx = \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial}{\partial x} (f(x, t) + \tau \frac{\partial^2 u_x}{\partial x^2}) \right) dx
\]

\[
\implies \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \left( \frac{\partial^2 u_x}{\partial t \partial x} + \frac{1}{2} \frac{\partial (u_x^2)}{\partial x^2} \right) \right) dx = \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial f(x, t)}{\partial x} + \tau \frac{\partial^3 u_x}{\partial x^3} \right) dx
\]

\[
\implies \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^2 u_x}{\partial t \partial x} \right) dx + \frac{1}{2} \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^2 (u_x^2)}{\partial x^2} \right) dx = \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial f(x, t)}{\partial x} \right) dx + \tau \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^3 u_x}{\partial x^3} \right) dx
\]

Put

\[
I_1 = \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^2 u_x}{\partial t \partial x} \right) dx, \quad I_2 = \frac{1}{2} \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial (u_x^2)}{\partial x^2} \right) dx
\]

\[
I_3 = \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial f(x, t)}{\partial x} \right) dx, \quad I_4 = \tau \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^3 u_x}{\partial x^3} \right) dx.
\]

We have

\[
I_1 = \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^2 u_x}{\partial t \partial x} \right) dx = \int_a^b \frac{\partial}{\partial t} \left( \frac{\partial u_x}{\partial x} \right) sg_\eta \left( \frac{\partial u_x}{\partial x} \right) dx
\]

\[
= \int_a^b \frac{\partial}{\partial t} \left( \frac{\partial u_x}{\partial x} \right) ab_\eta \left( \frac{\partial u_x}{\partial x} \right) dx = \int_a^b \frac{\partial}{\partial t} \left( ab_\eta \left( \frac{\partial u_x}{\partial x} \right) \right) dx = \frac{\partial}{\partial t} \int_a^b \left( ab_\eta \left( \frac{\partial u_x}{\partial x} \right) \right) dx
\]

\[
I_2 = \frac{1}{2} \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^2 (u_x^2)}{\partial x^2} \right) dx = \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) u_x \frac{\partial u_x}{\partial x} \right) \bigg|_a^b - \int_a^b \frac{\partial u_x}{\partial x} sg_\eta \left( \frac{\partial u_x}{\partial x} \right) u_x \frac{\partial u_x}{\partial x} dx
\]

\[
|I_3| = \left| \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial f(x, t)}{\partial x} \right) dx \right| \leq \int_a^b \left| \frac{\partial f(x, t)}{\partial x} \right| dx
\]

\[
I_4 = \tau \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^3 u_x}{\partial x^3} \right) dx = \left( \tau sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^3 u_x}{\partial x^3} \right) \bigg|_a^b - \tau \int_a^b \left( sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^2 u_x}{\partial x^2} \right)^2 dx
\]

\[
= \left( \tau sg_\eta \left( \frac{\partial u_x}{\partial x} \right) \frac{\partial^2 u_x}{\partial x^2} \right) \bigg|_a^b - \tau \int_{\eta \leq |\frac{\partial u_x}{\partial x}|} (\frac{\partial^2 u_x}{\partial x^2})^2 dx.
\]
Then

\[
(3.1) \Rightarrow \frac{\partial}{\partial t} \int_a^b ab \eta (\frac{\partial u}{\partial x}) dx + (sg\eta (\frac{\partial u}{\partial x}) u - f(x, t))|_a^b \int_a^b \frac{\partial^2 u}{\partial x^2} s g\eta' (\frac{\partial u}{\partial x}) u dx =
\]

\[
(s g\eta (\frac{\partial u}{\partial x}) f(x, t))|_a^b - \frac{1}{\eta} \int_a^b \frac{\partial^2 u}{\partial x^2} f(x, t) dx + \left( \tau s g\eta (\frac{\partial u}{\partial x}) \frac{\partial^2 u}{\partial x^2} \right) \bigg|_a^b
\]

\[
\frac{\partial}{\partial t} \int_a^b ab \eta (\frac{\partial u}{\partial x}) dx + (sg\eta (\frac{\partial u}{\partial x}) (u - f(x, t) - \tau \frac{\partial^2 u}{\partial x^2})) \bigg|_a^b
\]

\[
= \int_a^b \frac{\partial^2 u}{\partial x^2} s g\eta (\frac{\partial u}{\partial x}) u dx - \frac{1}{\eta} \int_a^b \frac{\partial^2 u}{\partial x^2} f(x, t) dx - \frac{\tau}{\eta} \int_a^b \left( \frac{\partial^2 u}{\partial x^2} \right)^2 dx
\]

\[
\Rightarrow \frac{\partial}{\partial t} \int_a^b ab \eta (\frac{\partial u}{\partial x}) dx = - (sg\eta (\frac{\partial u}{\partial x}) \frac{\partial u}{\partial x}) \bigg|_a^b + \int_a^b \frac{\partial^2 u}{\partial x^2} s g\eta' (\frac{\partial u}{\partial x}) u dx
\]

\[
- \frac{1}{\eta} \int_a^b \frac{\partial^2 u}{\partial x^2} f(x, t) dx - \frac{\tau}{\eta} \int_a^b \left( \frac{\partial^2 u}{\partial x^2} \right)^2 dx.
\]

Since

\[
\int \left( \frac{\partial^3 u}{\partial x^3} \right)^2 dx \geq 0,
\]

\[
\{ x : |\frac{\partial u}{\partial x}| < \eta \}
\]

then

\[
(3.1) \Rightarrow \frac{\partial}{\partial t} \int_a^b ab \eta (\frac{\partial u}{\partial x}) dx \leq - (sg\eta (\frac{\partial u}{\partial x}) \frac{\partial u}{\partial x}) \bigg|_a^b + \int_a^b \frac{\partial^2 u}{\partial x^2} s g\eta' (\frac{\partial u}{\partial x}) u dx
\]

\[
- \frac{1}{\eta} \int_a^b \frac{\partial^2 u}{\partial x^2} f(x, t) dx
\]

Moreover,

\[
\left| \int_a^b \frac{\partial^3 u}{\partial x^3} \right| \leq \int \left| \frac{\partial^2 u}{\partial x^2} \right| \left| \frac{\partial u}{\partial x} \right| \left| u \right| dx
\]

\[
\leq M_0 \int \left| \frac{\partial^2 u}{\partial x^2} \right| \left| \frac{\partial u}{\partial x} \right| dx \leq M_0 \int \left| \frac{\partial^2 u}{\partial x^2} \right| dx.
\]
Therefore it holds the following estimate:

\[
\left( -sgn(\frac{\partial u_\tau}{\partial x}) \frac{\partial u_\tau}{\partial t} \right)_{a}^{b} \leq \frac{\partial u_1(t)}{\partial t} + \frac{\partial u_2(t)}{\partial t}
\]

We take a limit as \( \eta \to 0 \), then

\[
(3.1) \quad \Rightarrow \lim_{\eta \to 0} \frac{\partial}{\partial t} \int_{a}^{b} ab_\eta(\frac{\partial u_\tau}{\partial x})dx \leq \frac{\partial u_1(t)}{\partial t} + \frac{\partial u_2(t)}{\partial t}
\]

It holds the following estimate:

\[
\left| \frac{\partial u_\tau(t)}{\partial x} \right|_{L^1([a, b])} \leq \left| \frac{\partial u_\tau(0)}{\partial x} \right|_{L^1([a, b])} + \int_{0}^{t} \left( \left| \frac{\partial u_1(t)}{\partial t} \right| + \left| \frac{\partial u_2(t)}{\partial t} \right| \right) dt
\]

\[
\leq \left| \frac{\partial u_\tau(0)}{\partial x} \right|_{L^1([a, b])} + \int_{0}^{T} \left( \left| \frac{\partial u_1(t)}{\partial t} \right| + \left| \frac{\partial u_2(t)}{\partial t} \right| \right) dt \leq M_1(T).
\]

Therefore

\[
(3.2) \quad \left| \frac{\partial u_\tau(t)}{\partial x} \right|_{L^1([a, b])} \leq M_1(T).
\]

\[\blacksquare\]

**Theorem 7.** (estimate of \( \frac{\partial u_\tau}{\partial t} \) in \( L^1([a, b] \times [0, T]) \)) We have the following estimate:

\[
\left| \frac{\partial u_\tau}{\partial t} \right|_{L^1([a, b])} \leq M_4(T).
\]

**Proof.** We introduce the following function:

\[
\phi(x, t) = u_1(t) \frac{x - b}{a - b} + u_2(t) \frac{x - a}{b - a}
\]

and put

\[
u_\tau(x, t) = v_\tau(x, t) + \phi(x, t)
\]
Existence and uniqueness of an entropy solution

1643
to obtain homogeneous boundary conditions. Then, a function \( v_\tau(x, t) \) verifies equation

\[
\frac{\partial (v_\tau + \phi)}{\partial t} + \frac{1}{2} \frac{\partial (v_\tau + \phi)^2}{\partial x} = f(x, t) + \tau \frac{\partial^2 (v_\tau + \phi)}{\partial x^2},
\]

and since

\[
\frac{\partial^2 \phi}{\partial x^2} = 0
\]
then we have

(3.3)

\[
\frac{\partial v_\tau}{\partial t} + \frac{1}{2} \frac{\partial (v_\tau + \phi)^2}{\partial x} = -\frac{\partial \phi}{\partial t} + f(x, t) + \tau \frac{\partial^2 v_\tau}{\partial x^2}
\]

with initial and boundary conditions

\[
v_\tau(a, t) = 0 \quad v_\tau(b, t) = 0 \quad v_\tau(x, 0) = u_0(x) - \phi(x, 0)
\]

we derive (3.3) relate to \( t \), multiply by \( s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \) and integrate on \([a, b] \). We obtain

\[
\frac{\partial}{\partial t} \int_a^b a b_{\eta}(\frac{\partial v_\tau}{\partial t}) dx + \frac{1}{2} \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 (v_\tau + \phi)^2}{\partial x \partial t} dx =
\]

(3.4)

\[-\int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 \phi}{\partial t^2} dx + \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial f(x, t)}{\partial t} dx + \tau \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^3 v_\tau}{\partial x^2 \partial t} dx
\]

Put

\[
I n_1 = \frac{1}{2} \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 (v_\tau + \phi)^2}{\partial x \partial t} dx, \quad I n_2 = \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 \phi}{\partial t^2} dx
\]

\[
I n_3 = \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial f(x, t)}{\partial t} dx, \quad I n_4 = \tau \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^3 v_\tau}{\partial x^2 \partial t} dx
\]

We have

\[
I n_1 = \frac{1}{2} \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 (v_\tau + \phi)^2}{\partial x \partial t} dx
\]

\[
= (\frac{1}{2} s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial (v_\tau + \phi)^2}{\partial x}) \bigg|_a^b - \frac{1}{2} \int_a^b s g_{\eta}(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial x \partial t} \frac{\partial (v_\tau + \phi)^2}{\partial t} dx
\]
and since \(v_\tau(a, t) = 0\) and \(v_\tau(b, t) = 0\) then \((\frac{1}{\tau}sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial (v_\tau + \phi)}{\partial t})\bigg|_a^b = 0\). Therefore, one has

\[
I_{n_1} = -\frac{1}{2} \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial \eta \partial t} \frac{\partial (v_\tau + \phi)}{\partial t} dx
\]

\[
= - \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial \eta \partial t} (v_\tau + \phi) dx - \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial \eta \partial t} (v_\tau + \phi) \frac{\partial \phi}{\partial t} dx
\]

\[
= - \int_{\{ x : \frac{\partial v_\tau}{\partial t} < \eta \}} \frac{\partial^2 v_\tau}{\partial \eta \partial t} (v_\tau + \phi) dx + \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) (\frac{\partial (v_\tau + \phi)}{\partial t} + (v_\tau + \phi) \frac{\partial^2 \phi}{\partial \eta \partial t}) dx
\]

\[
= - \int_{\{ x : \frac{\partial v_\tau}{\partial t} < \eta \}} \frac{\partial^2 v_\tau}{\partial \eta \partial t} (v_\tau + \phi) dx + \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) (\frac{\partial u_\tau}{\partial x} \frac{\partial \phi}{\partial t} + u_\tau \frac{\partial^2 \phi}{\partial \eta \partial t}) dx.
\]

since

\[
\left| \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) (\frac{\partial (v_\tau + \phi)}{\partial t} + (u_\tau) \frac{\partial^2 \phi}{\partial \eta \partial t}) dx \right| \leq \int_a^b \left| \frac{\partial u_\tau}{\partial x} \frac{\partial \phi}{\partial t} + u_\tau \frac{\partial^2 \phi}{\partial \eta \partial t} \right| dx
\]

\[
\leq \int_a^b \left| \frac{\partial \phi}{\partial t} \right| + \left| \frac{\partial u_\tau}{\partial x} \frac{\partial \phi}{\partial t} \right| dx
\]

\[
\int_{\{ x : \frac{\partial v_\tau}{\partial t} < \eta \}} \frac{\partial^2 v_\tau}{\partial \eta \partial t} (v_\tau + \phi) dx \to 0 \text{ as } \eta \to 0 \text{ (by Saks Lemma)},
\]

\[
I_{n_4} = \tau \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial \eta \partial t} dx
\]

\[
= \left( \tau sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial \eta \partial t} \right)^b_a - \tau \left| \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial \eta \partial t} dx \right|^2 - \tau \left| \int_a^b sg_\eta(\frac{\partial v_\tau}{\partial t}) \frac{\partial^2 v_\tau}{\partial \eta \partial t} dx \right|^2 dx \leq 0
\]
It holds that
\[
\int_a^b s g_\eta \left( \frac{\partial v_\tau}{\partial t} \right) \frac{\partial f(x, t)}{\partial t} \, dx \leq \int_a^b \left| \frac{\partial f(x, t)}{\partial t} \right| \, dx,
\]
and
\[
\left| I_{n_2} \right| = \left| \int_a^b s g_\eta \left( \frac{\partial v_\tau}{\partial t} \right) \frac{\partial^2 \phi(x, t)}{\partial t^2} \, dx \right| \leq \int_a^b \left| \frac{\partial^2 \phi(x, t)}{\partial t^2} \right| \, dx \leq \int_a^b \left| \frac{\partial^2 u_1(t)}{\partial t^2} \right| \, dx + \int_a^b \left| \frac{\partial^2 u_2(t)}{\partial t^2} \right| \, dx
\]
\[
\leq \int_a^b \left| \frac{\partial^2 u_1(t)}{\partial t^2} \right| \, dx + \int_a^b \left| \frac{\partial^2 u_2(t)}{\partial t^2} \right| \, dx
\]
We take a limit as \( \eta \to 0 \) in equation (3.4), then
\[
\lim_{(\eta \to 0)} \frac{\partial}{\partial t} \int_a^b s g_\eta(\frac{\partial v_\tau}{\partial t}) \, dx = \frac{\partial}{\partial t} \int_a^b \left| \frac{\partial v_\tau}{\partial t} \right| \, dx
\]
\[
\leq \int_a^b \left( \frac{\partial \phi}{\partial t} \right) \left| \frac{\partial u_\tau}{\partial x} \right| + \left| u_\tau \right| \left| \frac{\partial^2 \phi}{\partial x^2} \right| \, dx + \int_a^b \left| \frac{\partial f(x, t)}{\partial t} \right| \, dx + \int_a^b \left| \frac{\partial^2 u_1(t)}{\partial t^2} \right| \, dx + \int_a^b \left| \frac{\partial^2 u_2(t)}{\partial t^2} \right| \, dx \leq M(t)
\]
Or for any \( t \in ]0, T[ \), we have
\[
\int_a^b \left| \frac{\partial v_\tau(x, t)}{\partial t} \right| \, dx \leq \int_0^t M(t) \, dt + \int_a^b \left| \frac{\partial v_\tau(x, 0)}{\partial t} \right| \, dx
\]
It holds that
\[
\frac{\partial v_\tau(x, 0)}{\partial t} = -\frac{1}{2} \frac{\partial (u_0)^2}{\partial x} - \frac{\partial \phi(x, 0)}{\partial t} + f(x, 0) + \tau \frac{\partial^2 u_0}{\partial x^2}
\]
where
\[
\frac{\partial \phi(x, 0)}{\partial t} = \frac{\partial u_1(t)}{\partial t} \frac{x - b}{a - b} + \frac{\partial u_2(t)}{\partial t} \frac{x - a}{b - a}
\]
is bounded independently of \( \tau \). Then we can bounded \( \frac{\partial \phi(x, 0)}{\partial t} \) by a constant \( cste \).
Therefore we obtain
\[
\int_a^b \left| \frac{\partial v_\tau(x, t)}{\partial t} \right| \, dx \leq \int_0^t M(t) \, dt + \int_a^b |cste| \, dx \leq \int_0^T M(t) \, dt + \int_a^b |cste| \, dx \leq M_2(T)
\]
and thus

\[ u_\tau(x, t) = v_\tau(x, t) + \phi(x, t) \]

\[ \Rightarrow \frac{\partial u_\tau(x,t)}{\partial t} = \frac{\partial v_\tau(x,t)}{\partial t} + \frac{\partial \phi(x,t)}{\partial t} \Rightarrow \left| \frac{\partial u_\tau(x,t)}{\partial t} \right| \leq \left| \frac{\partial v_\tau(x,t)}{\partial t} \right| + \left| \frac{\partial \phi(x,t)}{\partial t} \right| \]

\[ \Rightarrow \int_a^b \left| \frac{\partial u_\tau(x,t)}{\partial x} \right| \, dx \leq \int_a^b \left| \frac{\partial v_\tau(x,t)}{\partial x} \right| \, dx + \int_a^b \left| \frac{\partial \phi(x,t)}{\partial x} \right| \, dx \Rightarrow \int_a^b \left| \frac{\partial u_\tau(x,t)}{\partial x} \right| \, dx \leq M_2 + \int_a^b \left| \frac{\partial \phi(x,t)}{\partial x} \right| \, dx \]

It holds

(3.5) \[ \left| \frac{\partial u_\tau}{\partial t} \right|_{L^1([a,b])} \leq M_4(T) \]

\[ \blacksquare \]

4. Passage to a Limit and Characterization

Estimates (2.3), (3.2) and (3.5) ensure that for all \( \tau > 0 \), solution \( u_\tau \) remains in a bounded set of \( W^{1,1}([a, b] \times ]0, T[) \). Then we can apply Riesz-Tamarkin Theorem 2.1 and conclude that there exists a sequence \( u_{\tau_n} \) convergente in \( L^1([a, b[ \times ]0, T[) \). We denote \( u \in BV([a, b[ \times ]0, T[) \) a limit of this sequence.

Moreover, one has

\[ \tau \frac{\partial^2 u_\tau}{\partial x^2} = \frac{\partial u_\tau}{\partial t} + \frac{1}{2} \frac{\partial (u_\tau^2)}{\partial x} - f(x, t) \]

integrating on \( ]a, b[ \), for all \( t \in ]0, T[ \) then

\[ \left| \frac{\tau \frac{\partial^2 u_\tau}{\partial x^2}}{\partial x} \right|_{L^1([a,b])} \leq \left| \frac{\partial u_\tau}{\partial t} \right|_{L^1([a,b])} + \left| u_\tau \right|_{L^\infty([a,b])} \left| \frac{\partial u_\tau}{\partial x} \right|_{L^1([a,b])} + \left| f(x, t) \right|_{L^1([a,b])} \]

\[ \Rightarrow \left| \frac{\tau \frac{\partial^2 u_\tau}{\partial x^2}}{\partial x} \right|_{L^1([a,b])} + \left| \frac{\partial u_\tau}{\partial x} \right|_{L^1([a,b])} \leq \left| \frac{\partial u_\tau}{\partial t} \right|_{L^1([a,b])} + \left| u_\tau \right|_{L^\infty([a,b])} \left| \frac{\partial u_\tau}{\partial x} \right|_{L^1([a,b])} + \left| f(x, t) \right|_{L^1([a,b])} \]

\[ \Rightarrow \left| \frac{\tau \frac{\partial^2 u_\tau}{\partial x^2}}{\partial x} \right|_{L^1([a,b])} + \left| \frac{\partial u_\tau}{\partial x} \right|_{L^1([a,b])} \leq \left| \frac{\partial u_\tau}{\partial t} \right|_{L^1([a,b])} + \left| u_\tau \right|_{L^\infty([a,b])} \left| \frac{\partial u_\tau}{\partial x} \right|_{L^1([a,b])} + \left| f(x, t) \right|_{L^1([a,b])} \]

We have

\[ M^*(t) \leq r \Rightarrow M^*(t)^2 \leq r^2 \Rightarrow \int_0^T M^*(t)^2 \, dt \leq \int_0^T r^2 \, dt = r^2 T. \]

A function \( M^*(t) \in L^2([0, T[) \). This estimate lets through to a weak limit on expressions \( \tau \frac{\partial u_\tau(a, t)}{\partial x} \).
Existence and uniqueness of an entropy solution

Let \( \varphi(t) \in L^2([0,T]) \), we prolonge a function \( \varphi(t) \) on \([a,b] \times [0,T]\) by putting

\[
\varphi_\tau(x, t) = \begin{cases} 
\varphi(t) \frac{x + a}{2} & \text{if } a < x < a + \tau \\
0 & \text{if } x \geq a + \tau
\end{cases}
\]

Remark that

\[
\tau \frac{\partial \varphi_\tau(x, t)}{\partial x} = -\varphi(t) \quad \text{if } a < x < a + \tau \quad \text{and} \quad \varphi_\tau(a, t) = \varphi(t)
\]

Then we integrate by parts

\[
\tau \int_a^b \int_0^T \frac{\partial^2 u_\tau}{\partial x^2}(x, t) \varphi_\tau(x, t) dt dx = \left( \int_0^T \frac{\partial u_\tau}{\partial x}(x, t) \varphi_\tau(x, t) dt \right) \bigg|_a^b - \tau \int_0^T \frac{\partial^2 u_\tau}{\partial x^2}(x, t) \frac{\partial \varphi_\tau(x, t)}{\partial x} dt
\]

\[
= \int_0^T \tau \frac{\partial u_\tau}{\partial x}(a, t) \varphi(t) dt + \tau \int_0^T \int_a^b \frac{\partial u_\tau}{\partial x}(x, t) \varphi(t) dt dx dt
\]

It holds

\[
\left| \int_0^T \tau \frac{\partial u_\tau}{\partial x}(a, t) \varphi(t) dt \right| \leq \int_0^T \left| \tau \int_a^b \frac{\partial^2 u_\tau}{\partial x^2}(x, t) \varphi_\tau(x, t) dx \right| dt + \int_0^T \tau \left| \int_a^b \frac{\partial u_\tau}{\partial x}(x, t) \varphi_\tau(x, t) dx \right| dt
\]

\[
\leq \int_0^T \tau \left| \frac{\partial^2 u_\tau}{\partial x^2}(x, t) \right| \varphi_\tau(x, t) dx dt + \int_0^T \tau \left| \frac{\partial u_\tau}{\partial x}(x, t) \right| \varphi_\tau(x, t) dx dt
\]

\[
\leq \int_0^T \left| \varphi(t) \right| \int_a^b \left( \tau \left| \frac{\partial^2 u_\tau}{\partial x^2}(x, t) \right| + \tau \left| \frac{\partial u_\tau}{\partial x}(x, t) \right| \right) dx dt
\]

\[
\leq \int_0^T \left| \varphi(t) \right| M^*(t) dx dt \leq \left| \varphi(t) \right|_{L^2([0,T])} \left| M^*(t) \right|_{L^2([0,T])}
\]

So, \( \tau \frac{\partial u_\tau}{\partial x}(a, t) \) remains bounded in \( L^2([0,T]) \), and from this sequence we can extract a subsequence \( \tau_n \frac{\partial u_\tau}{\partial x}(a, t) \) which converges for a weak topology of \( L^2([0,T]) \). Suppose a limit of this sequence is \( \gamma_a \).

We proceed in the same way at \( x = b \) consider the prolongement of a function \( \varphi(t) \) on \([a,b] \times [0,T]\) taking

\[
\varphi_\tau(x, t) = \begin{cases} 
0, & \text{if } x \leq b - \tau \\
\varphi(t) \frac{b - \tau + x}{\tau} & \text{if } b - \tau < x < b
\end{cases}
\]

Remark that

\[
\varphi_\tau(b, t) = -\varphi(t) \quad \text{and} \quad \tau \frac{\partial \varphi_\tau(x, t)}{\partial x} = \varphi(t).
\]
Then we integrate by parts

\[
T \int_a^b \frac{\partial^2 u}{\partial x^2}(x, t) \varphi(x, t) \, dx \, dt = \left( T \int_0^T \frac{\partial^2 u}{\partial x^2}(x, t) \varphi(x, t) \, dt \right) \bigg|_a^b - \tau \int_a^b \frac{\partial u}{\partial x}(x, t) \frac{\partial \varphi(x, t)}{\partial x} \, dt
\]

\[
= \int_0^T - \tau \frac{\partial u}{\partial x}(b, t) \varphi(t) \, dt - \tau \int_0^T \frac{\partial u}{\partial x}(x, t) \varphi(t) \, dt.
\]

It holds that

\[
\left| \int_0^T \tau \frac{\partial u}{\partial x}(b, t) \varphi(t) \, dt \right| \leq \left| \tau \int_0^T \frac{\partial^2 u}{\partial x^2}(x, t) \varphi(x, t) \, dx \, dt \right| + \left| \tau \int_0^T \frac{\partial u}{\partial x}(x, t) \varphi(t) \, dx \, dt \right|
\]

\[
\leq \tau \int_0^T \left| \frac{\partial u}{\partial x}(x, t) \right| \left| \varphi(x, t) \right| \, dx \, dt + \tau \int_0^T \left| \frac{\partial u}{\partial x}(x, t) \right| \left| \varphi(t) \right| \, dx \, dt
\]

\[
\leq \int_0^T \left| \varphi(t) \right| \left| \int_0^T \tau \left| \frac{\partial^2 u}{\partial x^2}(x, t) \right| \, dx \, dt \right| + \tau \left| \frac{\partial u}{\partial x}(x, t) \right| \, dx \, dt
\]

\[
\leq \int_0^T \left| \varphi(t) \right| M^*(t) \, dx \, dt \leq \left| \varphi(t) \right|_{L^2([0, T])} \left| M^*(t) \right|_{L^2([0, T])}.
\]

So, \( \tau \frac{\partial u}{\partial x}(b, t) \) remains bounded in \( L^2([0, T]) \), and from this sequence we can extract a subsequence \( \tau_n \frac{\partial u}{\partial x}(b, t) \) which converges for a weak topology of \( L^2([0, T]) \). Suppose its limit is \( \gamma_0 \).

For any \( \tau > 0 \) let \( \{u_{\tau_n}\} \) be the previous extract sequence. Now, we will prove \( u_{\tau} \) is a global solution to problem (2.2).

**Theorem 8.** We have

\[
T \int_a^b \left| (|u - k|) \frac{\partial \varphi}{\partial x} + sg_0(u - k)(\frac{u^2}{2} - f(x, t) \varphi) \right| \, dx \, dt + \int_a^b |u_0(x) - k| \varphi(x, 0) \, dx
\]

\[
\geq \int_0^T sg_0(u_2(t) - k)(\frac{u_2^2(t) - u_1(t) - x(t)}{2}) \varphi(b, t) \, dt - \int_0^T sg_0(u_1(t) - k)(\frac{u_1^2(t) - x(t)}{2}) \varphi(a, t) \, dt,
\]

which gives a characterization of inquired solution of (2.1) in \( BV([a, b] \times [0, T]) \cap L^\infty([a, b] \times [0, T]) \) and where \( \tau_{u_8}(t) \) is a trace of \( u(\cdot, t) \) at \( a \).
Proof. Let $k \in \mathbb{R}$, $\varphi \in C^2([a, b] \times [0, T])$ such that $\varphi(x, T) = 0$ for all $x \in [a, b]$ and verified

$$\forall (x, t) \in [a, b] \times [0, T], \quad \varphi(x, t) \geq 0.$$ 

Let $\eta > 0$. We multiply (2.2) by $sg_{\eta}(u_{\tau} - k)$. Introducing a function $G_{\eta, k}(u_{\tau})$ defined by

$$\begin{cases}
\frac{\partial G_{\eta, k}(u_{\tau})}{\partial x} = sg_{\eta}(u_{\tau} - k)u_{\tau}\frac{\partial u_{\tau}}{\partial x} \\
G_{\eta, k}(k) = 0,
\end{cases}$$

then

$$sg_{\eta}(u_{\tau} - k)\frac{\partial u_{\tau}}{\partial t} + sg_{\eta}(u_{\tau} - k)u_{\tau}\frac{\partial u_{\tau}}{\partial x} = sg_{\eta}(u_{\tau} - k)f(x, t) + \tau sg_{\eta}(u_{\tau} - k)\frac{\partial^2 u_{\tau}}{\partial x^2}$$

and

$$(4.1) \quad \frac{\partial ab_{\eta}(u_{\tau} - k)}{\partial t} + \frac{\partial G_{\eta, k}(u_{\tau})}{\partial x} = sg_{\eta}(u_{\tau} - k)f(x, t) + \tau sg_{\eta}(u_{\tau} - k)\frac{\partial^2 u_{\tau}}{\partial x^2}$$

We multiply again by $\varphi(x, t)$ and we integrate by parts on $[a, b] \times [0, T]$ to obtain

$$\int_0^T \int_a^b \frac{\partial ab_{\eta}(u_{\tau} - k)}{\partial t} \varphi \, dx \, dt + \int_0^T \int_a^b \frac{\partial G_{\eta, k}(u_{\tau})}{\partial x} \varphi \, dx \, dt = \int_0^T \int_a^b sg_{\eta}(u_{\tau} - k)f(x, t)\varphi \, dx \, dt$$

$$+ \int_0^T \int_a^b (\tau sg_{\eta}(u_{\tau} - k)\varphi) \frac{\partial^2 u_{\tau}}{\partial x^2} \, dx \, dt$$
\[
\begin{aligned}
\Rightarrow & \quad -\int_a^b a \eta(u_0(x) - k) \varphi(x, 0) \, dx - \int_0^b \int_a^b a \eta(u_t - k) \frac{\partial \varphi}{\partial t} \, dx \, dt \\
& - \int_0^b \int_a^b a \eta(u_t) \frac{\partial \varphi}{\partial x} \, dx \, dt + \int_0^b \int_a^b a \eta(u_2(t)) \varphi(b, t) - G_{\eta, k}(u_1(t)) \varphi(a, t) \, dt \\
= & \quad \int_0^b \tau \varphi(u_2(t) - k) \frac{\partial u_t(b, t)}{\partial x} \varphi(b, t) - \tau \varphi(u_1(t) - k) \frac{\partial u_t(a, t)}{\partial x} \varphi(a, t) \, dt \\
& - \int_0^b \int_a^b a \frac{\partial \varphi}{\partial x} \tau \varphi(u_t - k) \varphi(x, t) \frac{\partial u_t}{\partial x} \, dx \, dt + \int_0^b \int_a^b a \delta \varphi \eta(u_t - k) g(x, t) \varphi dx \, dt \\
\Rightarrow & \quad \int_a^b a \eta(u_0(x) - k) \varphi(x, 0) \, dx + \int_0^b \int_a^b a \eta(u_t - k) \frac{\partial \varphi}{\partial t} \, dx \, dt + \int_0^b \int_a^b a \varphi \eta(u_2(t)) \varphi(b, t) dt + \int_0^b \int_a^b a \varphi \eta(u_1(t)) \varphi(a, t) \, dt \\
= & \quad -\int_0^b (\tau \varphi(u_2(t) - k) \frac{\partial u_t(b, t)}{\partial x} \varphi(b, t) - \tau \varphi(u_1(t) - k) \frac{\partial u_t(a, t)}{\partial x} \varphi(a, t)) \, dt + \int_0^b \int_a^b a \frac{\partial \varphi}{\partial x} \tau \varphi(u_t - k) \varphi(x, t) \frac{\partial u_t}{\partial x} \, dx \, dt \\
& - \int_0^b \int_a^b a \frac{\partial \varphi}{\partial x} \tau \varphi(u_t - k) \varphi(x, t) \frac{\partial u_t}{\partial x} \, dx \, dt - \int_0^b \int_a^b a \frac{\partial \varphi}{\partial x} \tau \varphi(u_t - k) \varphi(x, t) \frac{\partial u_t}{\partial x} \, dx \, dt \\
= & \quad \int_0^b (\tau \varphi(u_1(t) - k) \varphi(a, t) \frac{\partial u_t(a, t)}{\partial x} \varphi(a, t) - \tau \varphi(u_2(t) - k) \varphi(b, t) \frac{\partial u_t(b, t)}{\partial x} \varphi(b, t)) \, dt \\
& + \int_0^b \int_a^b a \varphi \eta(u_2(t)) \varphi(b, t) dt - \int_0^b \int_a^b a \varphi \eta(u_1(t)) \varphi(a, t) \, dt - \int_a^b a \eta(u_0(x) - k) \varphi(x, 0) \, dx.
\end{aligned}
\]
\[ \Rightarrow \int \int_{a}^{b} (ab_{\eta}(u_{\tau} - k) \frac{\partial \varphi}{\partial t} \, dx \, dt + s g_{\eta}(u_{\tau} - k) f(x, t) \varphi + G_{\eta, k}(u_{\tau}) \frac{\partial \varphi}{\partial x} \]

\[ - \tau s g_{\eta}(u_{\tau} - k) \frac{\partial u_{\tau}}{\partial x} \, dx \, dt - \int_{0}^{T} \int_{a}^{b} \frac{\partial s g_{\eta}(u_{\tau} - k) \varphi(x, t)}{\partial u} \, dx \, dt \]

\[ = \int_{0}^{T} \int_{a}^{b} (\tau s g_{\eta}(u_{1}(t) - k) \varphi(a, t)) \frac{\partial u(a, t)}{\partial x} \, dx \, dt - \int_{0}^{T} \int_{a}^{b} (\tau s g_{\eta}(u_{2}(t) - k) \varphi(b, t)) \frac{\partial u(b, t)}{\partial x} \, dx \, dt \]

\[ + \int G_{\eta, k}(u_{2}(t)) \varphi(b, t) \, dt - \int G_{\eta, k}(u_{1}(t)) \varphi(a, t) \, dt - \int_{a}^{b} (ab_{\eta}(u_{0}(x) - k) \varphi(x, 0) \, dx \]

and since

\[ \int_{a}^{b} \int_{0}^{T} (\tau s g_{\eta}(u - k) \frac{\partial \varphi(x, t)}{\partial u} \, dx \, dt \geq 0, \]

we have inequality

\[ \int_{a}^{b} \int_{0}^{T} (\tau s g_{\eta}(u - k) \frac{\partial u(a, t)}{\partial x} \, dx \, dt \]

\[ \geq \int_{0}^{T} \int_{a}^{b} (\tau s g_{\eta}(u_{1}(t) - k) \varphi(a, t)) \frac{\partial u(a, t)}{\partial x} \, dx \, dt - \int_{0}^{T} \int_{a}^{b} (\tau s g_{\eta}(u_{2}(t) - k) \varphi(b, t)) \frac{\partial u(b, t)}{\partial x} \, dx \, dt \]

\[ + \int G_{\eta, k}(u_{2}(t)) \varphi(b, t) \, dt - \int G_{\eta, k}(u_{1}(t)) \varphi(a, t) \, dt - \int_{a}^{b} (ab_{\eta}(u_{0}(x) - k) \varphi(x, 0) \, dx \]

for fixed \( \eta \), we take a limit as \( \tau \to 0 \) (because strongly convergence of \( u_{\tau} \) to \( u \)) and since

\[ \tau \frac{\partial u_{\tau}(a, t)}{\partial x} \to \gamma_a \quad \text{and} \quad \tau \frac{\partial u_{\tau}(b, t)}{\partial x} \to \gamma_b \quad (\text{weak convergence}), \]

then

\[ \lim_{(\tau \to 0)} \int_{a}^{b} \int_{0}^{T} (\tau s g_{\eta}(u - k) \frac{\partial \varphi(x, t)}{\partial x} \, dx \, dt = 0 \]

because

\[ \left| \int_{a}^{b} \int_{0}^{T} (\tau s g_{\eta}(u - k) \frac{\partial u}{\partial x} \, dx \, dt \right| \leq \tau \int_{a}^{b} \int_{0}^{T} \frac{\partial u}{\partial x} \, dx \, dt \]

\[ \leq \tau \left| \frac{\partial \varphi(x, t)}{\partial x} \right| _{L^{\infty}([a, b] \times [0, T])} \left| \frac{\partial u}{\partial x} \right| _{L^{1}([a, b] \times [0, T])} \leq \tau \left| \frac{\partial \varphi(x, t)}{\partial x} \right| _{L^{\infty}([a, b] \times [0, T])} \cdot M_1(T). \]
We have

\[
\begin{align*}
&\int_0^T \int_a^b (ab\eta(u_r - k)\frac{\partial \varphi}{\partial t}) \, dx \, dt + s\varrho(\eta)\varphi + G_{\eta, k}(u_r)\frac{\partial \varphi}{\partial x} \, dx \, dt \\
\geq &\int_0^T s\varrho(u_1(t) - k)\varphi(a, t)\gamma_a \, dt - s\varrho(u_2(t) - k)\varphi(b, t)\gamma_b + G_{\eta, k}(u_2(t))\varphi(b, t) \, dt \\
&- \int_0^T G_{\eta, k}(u_1(t))\varphi(a, t) \, dt - \int_a^b a\varrho(u_0(x) - k)\varphi(x, 0) \, dx.
\end{align*}
\]

We take a limit as \( \eta \to 0 \), we remark that

\[
\frac{\partial G_{\eta, k}(u)}{\partial x} = s\varrho(u - k)u\frac{\partial u}{\partial x} \Rightarrow \int \frac{\partial G_{\eta, k}(u)}{\partial x} \, dx = s\varrho(u - k)\int u\frac{\partial u}{\partial x} \, dx
\]

\[
\Rightarrow G_{\eta, k}(u) - G_{\eta, k}(k) = \frac{s\varrho(u - k)}{2}(u^2 - k^2) \Rightarrow G_{\eta, k}(u) = \frac{s\varrho(u - k)}{2}(u^2 - k^2).
\]

We obtain

\[
(4.2)
\]

\[
\int_0^T \int_a^b (\|u - k\|\frac{\partial \varphi}{\partial t} + s\varrho(u - k)((\frac{u^2 - k^2}{2})\frac{\partial \varphi}{\partial x} + f(x, t)\varphi)) \, dx \, dt + \int_a^b |u_0(x) - k|\varphi(x, 0) \, dx
\]

\[
\geq \int_0^T s\varrho(u_2(t) - k)((\frac{u_2^2 - k^2}{2}) - \gamma_b)\varphi(b, t) \, dt - \int_0^T s\varrho(u_1 - k)((\frac{u_1^2 - k^2}{2}) - \gamma_a)\varphi(a, t) \, dt
\]

It remains to identify \( \gamma_b \) and \( \gamma_a \). To do this, we take a particular function \( \varphi \) defined by

\[
\varphi(x, t) = \varphi(t)\vartheta_\rho(x) \quad (x, t) \in ]a, b[ \times ]0, T[
\]

with \( \varphi(t) \in C^2[0, T] \) and \( \varphi(t) \geq 0 \) such that \( \varphi(0) = 0, \varphi(T) = 0 \) and \( \vartheta_\rho(x) \in C^2[\{0, b\}], \vartheta_\rho(x) \geq 0 \) and \( \vartheta_\rho(x) \frac{\partial \vartheta_\rho(x)}{\partial x} \leq 0 \) such that

\[
0 < \rho < b - a, \vartheta_\rho(a) = 1, \vartheta_\rho(a + \rho) = 0,
\]

and \( \lim_{\rho \to 0} \vartheta_\rho(x) = 0 \) almost everywhere for \( x \in ]a, b[ \). Denote \( \varphi_{ua}(t) \) a trace of \( u(., t) \) at \( a \), we take a limit as \( \rho \to 0 \)

\[
\int_0^T \int_a^b (\|u - k\|\frac{\partial \varphi(t)}{\partial t} + s\varrho(u - k)f(x, t)\varphi(t))\vartheta_\rho(x) \, dx \, dt \to 0
\]
and
\[ \int_a^b |u_0(x) - k| \varpi(0) \vartheta(\rho)(x) \, dx = 0 \]

and
\[ \int_0^T s \varrho(\rho_2(t) - k)(\frac{u_1^2(t) - k^2}{2} - \gamma_0) \varpi(t) \vartheta(\rho)(b) \, dt = 0 \]

Therefore
\[
\begin{align*}
\int_a^b \int_0^T s \varrho(\rho_2(u - k)(\frac{u^2 - k^2}{2}) \varpi(x) \varpi(t)) \, dx \, dt &= \int_a^b \left( s \varrho(\rho_2(u - k)(\frac{u^2 - k^2}{2}) \varpi(x) \varpi(t)) \right) \, dx \, dt \\
- \int_0^T \frac{\partial}{\partial x} (s \varrho(\rho_2(u - k)(\frac{u^2 - k^2}{2}) \varpi(x))) \vartheta(\rho)(x) \, dx \, dt \rightarrow 0,
\end{align*}
\]

hence
\[
\begin{align*}
\int_a^b \int_0^T s \varrho(\rho_2(u - k)(\frac{u^2 - k^2}{2}) \varpi(x) \varpi(t)) \, dx \, dt &= \int_a^b \left( s \varrho(\rho_2(u - k)(\frac{u^2 - k^2}{2}) \varpi(x) \varpi(t)) \right) \, dx \, dt \\
- \int_0^T s \varrho(\rho_2(\varpi(t)) - k)(\frac{\varpi(t)^2 - k^2}{2}) \vartheta(\rho)(a) \varpi(t) \, dt.
\end{align*}
\]

Then it remains inequality
\[
\begin{align*}
\int_0^T s \varrho(\rho_2(\varpi(t)) - k)(\frac{\varpi(t)^2 - k^2}{2}) \vartheta(\rho)(a) \varpi(t) \, dt &\leq \int_0^T s \varrho(\rho_2(u_1 - k)(\frac{u_1^2(t) - k^2}{2}) - \gamma_0) \varpi(t) \vartheta(\rho)(a) \, dt \\
\Rightarrow \int_0^T s \varrho(\rho_2(\varpi(t)) - k)(\frac{\varpi(t)^2 - k^2}{2}) \vartheta(\rho)(a) \varpi(t) \, dt &\leq \int_0^T s \varrho(\rho_2(u_1 - k)(\frac{u_1^2(t) - k^2}{2}) - \gamma_0) \varpi(t) \vartheta(\rho)(a) \, dt
\end{align*}
\]

since a relation is true for all function \( \varpi(t) \geq 0 \), we have almost every where
\[
(4.3) \quad s \varrho(\rho_2(\varpi(t)) - k)(\frac{\varpi(t)^2 - k^2}{2}) \leq s \varrho(\rho_2(u_1 - k)(\frac{u_1^2(t) - k^2}{2}) - \gamma_0)
\]
take \( k > \max(\varpi(t), u_1(t)) \) and \( k < \min(\varpi(t), u_1(t)) \), it holds
\[
\frac{\varpi(t)^2 - k^2}{2} = \frac{u_1^2(t) - k^2}{2} - \gamma_0 \Rightarrow \gamma_0 = \frac{u_1^2(t) - \varpi(t)^2}{2}.
\]
By the same way using \( \vartheta_\rho(x) \geq 0 \), \( \frac{\partial \vartheta_\rho(x)}{\partial x} \geq 0 \) such that \( \vartheta_\rho(b) = 1 \), \( \vartheta_\rho(b - \rho) = 0 \). Denote \( \varpi_{ab}(t) \) a trace of \( u(., t) \) at \( b \) we obtain to a limit as \( \rho \to 0 \)

\[
\int_0^T s g_0(\varpi_{ab}(t) - k)(\varpi_{ab}(t)^2 - k^2) \varpi(t) dt \geq \int_0^T s g_0(u_2 - k)(\frac{u_2^2(t) - k^2}{2}) - \gamma_b) \varpi(t) dt.
\]

Hence

(4.4) \( s g_0(\varpi_{ab}(t) - k)(\varpi_{ab}(t)^2 - k^2) \geq s g_0(u_1 - k)(\frac{u_2^2(t) - k^2}{2}) - \gamma_b) \).

Take \( k > \max(\varpi_{ab}(t), u_2(t)) \) and \( k < \min(\varpi_{ab}(t), u_2(t)) \), it results

\[
\gamma_b = \frac{u_2^2(t) - \varpi_{ab}(t)^2}{2}
\]

Substitute \( \gamma_a \) and \( \gamma_b \) in (4.2) we obtain

(4.5)

\[
\int_0^b \int_{a}^b |u - k| \frac{\partial \varphi}{\partial t} + s g_0(u - k)((\frac{u^2 - k^2}{2}) + f(x, t)\varphi) dx dt + \int_a^b u_0(x) - k| \varphi(x, 0) dx
\]

\[
\geq \int_0^T s g_0(u_2(t) - k)(\frac{u_2^2(t) - \varpi_{ab}(t)^2}{2}) \varphi(b, t) dt - \int_0^T s g_0(u_1 - k)(\frac{u_1^2(t) - \varpi_{ab}(t)^2}{2}) \varphi(a, t) dt
\]

A formula (4.5) gives a characterization of inquired solution of (2.1) in \( BV([a, b[ \times ]0, T[) \cap L^\infty([a, b[ \times ]0, T[[. Moreover, substitute \( \gamma_a \) in (4.3), we obtain inequality

\[
\forall k \in \mathbb{R}, \ s g_0(\varpi_{aa}(t) - k)(\frac{\varpi_{aa}(t)^2 - k^2}{2}) \leq s g_0(u_1(t) - k)(\frac{u_1^2(t) - k^2}{2}) - (\frac{u_1^2(t) - \varpi_{aa}(t)^2}{2})
\]

\[
\Rightarrow s g_0(\varpi_{aa}(t) - k)(\frac{\varpi_{aa}(t)^2 - k^2}{2}) \leq s g_0(u_1(t) - k)(\frac{u_1^2(t) - \varpi_{aa}(t)^2}{2})
\]

\[
\Rightarrow (s g_0(u_1(t) - k) - s g_0(\varpi_{aa}(t) - k) \) (\frac{\varpi_{aa}(t)^2 - k^2}{2}) \geq 0
\]

(4.6) \( \Rightarrow s g_0(u_1(t) - \varpi_{aa}(t)) \) (\frac{\varpi_{aa}(t)^2 - k^2}{2}) \geq 0

Thus introducing interval \( I(t) = [\min(u_1(t), \varpi_{aa}(t)), \max(u_1(t), \varpi_{aa}(t))] \), we have

(4.7) \( \inf_{k \in I(t)} (s g_0(u_1(t) - \varpi_{aa}(t)) \) (\frac{\varpi_{aa}(t)^2 - k^2}{2}) = 0

In the same way, substitute \( \gamma_b \) in (4.4), we obtain inequality

\[
\forall k \in \mathbb{R}, \ (s g_0(u_2(t) - k) - s g_0(\varpi_{ab}(t) - k) \) (\frac{\varpi_{ab}(t)^2 - k^2}{2}) \leq 0
\]
(4.8) \[ s_0(u_2(t) - x_a(t)) \left( \frac{x_a(t)^2 - k^2}{2} \right) \leq 0 \]

Thus introducing interval \( J(t) = [\min(u_2(t), x_a(t)), \max(u_2(t), x_a(t))] \), we have

(4.9) \[ \sup_{k \in J(t)} s_0(u_1(t) - x_a(t)) \left( \frac{x_a(t)^2 - k^2}{2} \right) = 0. \]

Boundary conditions (4.7) and (4.9) are known Bardoux-Leroux-Nedelec conditions ([6], [10]).

**Theorem 9. (uniqueness theorem)** Problem (2.1) admits an unique solution.

**Proof.** Idea proof is based on the doubling of variables technique of S. N. Kružkhov ([4], [2]). Consider two solutions \( u \) and \( v \) of (2.1) characterised by (4.5) and belonging to \( BV([a, b[ \times ]0, T]) \cap L^\infty([a, b[ \times ]0, T]) \). We take a function \( \varphi \in C^\infty_c([a, b[ \times ]a, b[ \times ]0, T[ \times ]0, T[) \) in the form \( \varphi(x, y, t, s) \) where \( (x, y) \in ([a, b])^2 \) and \( (t, s) \in ([0, T])^2 \) with support enclosed in \( ([a, b[ \times ]0, T]) \). For fixed \( (y, s) \), we choose \( u \) satisfies (4.5) with \( k = v(y, s) \). It results that

\[
\int_0^T \int_a^b (|u-v| \frac{\partial \varphi}{\partial t} + s_0(u-v)((\frac{u^2-v^2}{2}) \frac{\partial \varphi}{\partial x} + f(x, t, \varphi)) dx dt \geq 0
\]

integrating at \( y \) and \( s \), we obtain

\[
\int_0^T \int_a^b \int_0^b (|u-v| \frac{\partial \varphi}{\partial t} + s_0(u-v)((\frac{u^2-v^2}{2}) \frac{\partial \varphi}{\partial x} + f(x, t, \varphi)) dx dy dt ds \geq 0.
\]

In the same way, \( v \) satisfies (4.5) with \( k = u(x, t) \), it results that

\[
\int_0^T \int_a^b (|v-u| \frac{\partial \varphi}{\partial s} + s_0(v-u)((\frac{u^2-v^2}{2}) \frac{\partial \varphi}{\partial y} + f(y, s, \varphi)) dy ds \geq 0
\]

\[
\Rightarrow \int_0^T \int_a^b (|v-u| \frac{\partial \varphi}{\partial s} + s_0(u-v)((\frac{u^2-v^2}{2}) \frac{\partial \varphi}{\partial y} - f(y, s, \varphi)) dy ds \geq 0
\]

because \( s_0(u-v) = -s_0(v-u) \). Integrating at \( x \) and \( t \), we obtain

\[
\int_0^T \int_0^T \int_a^b \int_a^b (|u-v| \frac{\partial \varphi}{\partial s} + s_0(u-v)((\frac{u^2-v^2}{2}) \frac{\partial \varphi}{\partial y} + f(y, s, \varphi)) dx dy dt ds \geq 0.
\]
Summing these two inequalities, it holds that

\[
\int_0^T \int_0^T \int_a^b \int_a^b (|v - u| \left( \frac{\partial \varphi}{\partial t} + \frac{\partial \varphi}{\partial s} \right) + sg_0(u - v)\left( \frac{(u^2 - v^2)}{2} \left( \frac{\partial \varphi}{\partial x} + \frac{\partial \varphi}{\partial y} \right) + (f(x, t) - f(y, s)) \varphi \right) dxdydt ds \geq 0.
\]

We take \( u = u(x, t) \) and \( v = v(y, s) \), we hope estimate a quantity \(|u(x, t) - v(x, t)|\).

**Theorem 10.** We have the following estimate:

\[
\int_a^b |v(x, t) - u(x, t)| dx \leq \int_a^b |\mathcal{X}_t(x) - \mathcal{X}_t(x)| dx
\]

where \( \mathcal{X}_t(x) \) denotes a trace of \( v(x, t) \) at \( t = 0 \) and \( \mathcal{X}_t(x) \) denotes a trace of \( u(x, t) \) at \( t = 0 \).

**Proof.** We construct a test function \( \varphi \) such that \((y, s)\) being near \((x, t)\) (we put unity approximation at \(t - s\) and at \(x - y\) in a test function). Let \( \theta_\alpha \in C^\infty_c([0, \alpha]) \) and \( \lambda_\beta \in C^\infty_c([a, a + \beta]) \) be two approximations of unity

\[
\int_0^\alpha \theta_\alpha(r) dr = 1, \quad \int_a^{a+\beta} \lambda_\beta(r) dr = 1.
\]

Let \( \phi \in C^\infty_c([0, T[ \times ]a, b[) \) be positive. Put \( \varphi(x, y, t, s) = \theta_\alpha(t-s)\lambda_\beta(x-y)\phi(x, t) \). Then, we have

\[
\frac{\partial \varphi(x, y, t, s)}{\partial t} + \frac{\partial \varphi(x, y, t, s)}{\partial s} = \theta_\alpha'(t-s)\lambda_\beta(x-y)\phi(x, t) + \theta_\alpha(t-s)\lambda_\beta(x-y)\frac{\partial \phi(x, t)}{\partial t}
\]

\[
-\theta_\alpha'(t-s)\lambda_\beta(x-y)\phi(x, t) = \theta_\alpha(t-s)\lambda_\beta(x-y)\frac{\partial \phi(x, t)}{\partial t}
\]

and by the same way

\[
\frac{\partial \varphi(x, y, t, s)}{\partial x} + \frac{\partial \varphi(x, y, t, s)}{\partial y} = \theta_\alpha(t-s)\lambda_\beta(x-y)\frac{\partial \phi(x, t)}{\partial x}.
\]

Then we obtain

\[
\int_0^T \int_0^T \int_a^b \int_a^b (\theta_\alpha(t-s)\lambda_\beta(x-y))(|v - u| \frac{\partial \phi(x, t)}{\partial t} + sg_0(u - v)\left( \frac{(u^2 - v^2)}{2} \frac{\partial \varphi}{\partial x} \right) + (f(x, t) - f(y, s)) \varphi) dx dy dt ds \geq 0
\]
We verify for each \( w \in L^p([0, T] \times [a, b] \times [0, T] \times [a, b]) \)

\[
\int_{0}^{T} \int_{a}^{b} \int_{0}^{T} \int_{a}^{b} w(x, y, t, s) (\theta_\alpha(t-s) \lambda_\beta(x-y)) dxdydt \rightarrow \int_{0}^{T} \int_{a}^{b} w(x, x, t, t) dxdt
\]

and

\[
\int_{0}^{T} \int_{a}^{b} \int_{0}^{T} \int_{a}^{b} |w(x, y, t, s)| (\theta_\alpha(t-s) \lambda_\beta(x-y)) dxdydt \rightarrow \int_{0}^{T} \int_{a}^{b} w(x, x, t, t) dxdt + w_1(\alpha, \beta)
\]

where \( w_1(\alpha, \beta) \rightarrow 0 \) as \( \alpha \) and \( \beta \) tend to 0. Expression (4.10) implies

\[
\int_{0}^{T} \int_{a}^{b} (|v(x, t) - u(x, t)|) \frac{\partial \phi(x,t)}{\partial t} + sg_0(u(x, t)) dxdt 
\]

\[
-\int_{0}^{T} \int_{a}^{b} (\frac{(u^2(x,t) - v^2(x,t))}{2}) \frac{\partial \phi}{\partial x} dxdt \geq 0
\]

(4.11)

Now we choose a function \( \phi \) of the form

\[
\phi(x,t) = \theta(t) \Psi_\delta(x)
\]

where \( \theta \in C_c^2([0, T]) \), \( \theta \geq 0 \) and \( \Psi_\delta \in C^2([a, b]) \), \( \Psi_\delta \geq 0 \), zero at \( x = a \) and \( x = b \), equal to 1 on \( ]a + \delta, b - \delta[ \) with \( \delta \in ]0, \frac{b-a}{2} [ \), fate tighten to zero. We introduce this
function $\phi$ in (4.11), to obtain

$$\int_0^b \int_a^b \left| v(x, t) - u(x, t) \right| \Psi_\delta(x) \frac{\partial \theta(t)}{\partial t} \, dx \, dt$$

$$+ \int_0^b \int_a^b (u(x, t) - v(x, t)) \left( \frac{u^2(x, t) - v^2(x, t)}{2} \right) \theta(t) \frac{\partial \Psi_\delta(x)}{\partial x} \, dx \, dt \geq 0$$

$$\Rightarrow \int_0^b \int_a^b \left| v(x, t) - u(x, t) \right| \Psi_\delta(x) \frac{\partial \theta(t)}{\partial t} \, dx \, dt$$

$$= \left. \right|_0^b \int_0^b \right|_a^b (u(x, t) - v(x, t)) \left( \frac{u^2(x, t) - v^2(x, t)}{2} \right) \chi_\delta(x) \theta(t) \, dt$$

$$\Rightarrow \int_0^b \int_a^b \left| v(x, t) - u(x, t) \right| \chi_\delta(x) \partial x \chi_\delta(x) \theta(t) \, dx \, dt$$

where $\chi_\delta(t)$ denotes a trace of $u$ at $x = b$. (we have $\Psi_\delta(b) = \Psi_\delta(a) = 0$)
We take a limit as $\delta \to 0$, then we obtain

$$
\Rightarrow \int_0^b \int_0^a |v(x, t) - u(x, t)| \frac{\partial \theta(t)}{\partial t} \, dx \, dt = \int_0^b \int_0^a \frac{\partial\theta_0(u(x, t) - v(x, t)) (\frac{u^2(x, t) - v^2(x, t)}{2}) \theta(t)}{\partial x} \, dx \, dt
$$

$$
\Rightarrow \int_0^b \int_0^a |v(x, t) - u(x, t)| \frac{\partial \theta(t)}{\partial t} \, dx \, dt = \int_0^b \left( \theta_0 \left( u(x, t) - v(x, t) \right) (\frac{u^2(x, t) - v^2(x, t)}{2}) \theta(t) \right) \bigg|_a^b \, dt
$$

$$
\Rightarrow \int_0^b \int_0^a |v(x, t) - u(x, t)| \frac{\partial \theta(t)}{\partial t} \, dx \, dt = \int_0^b \theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) (\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}) \theta(t) \, dt
$$

$$
- \int_0^b \theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) (\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}) \theta(t) \, dt
$$

retake inequality (4.6)

$$
\theta_0 \left( u_1(t) - \kappa_{ua}(t) \right) (\frac{\kappa_{ua}^2(t) - k^2}{2}) \geq 0
$$

with

$$
k = k(t) = \begin{cases} 
\kappa_{ua}(t) & \text{if } \kappa_{ua}(t) \text{ is between } u_1(t) \text{ and } \kappa_{va}(t) \\
u_1(t) & \text{if } u_1(t) \text{ is between } \kappa_{ua}(t) \text{ and } \kappa_{va}(t) \\
\kappa_{va}(t) & \text{if } \kappa_{va}(t) \text{ is between } u_1(t) \text{ and } \kappa_{ua}(t).
\end{cases}
$$

It holds for $k = u_1(t)$,

$$
\theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) (\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}) = \theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) (\frac{u_1^2(t) - \kappa_{va}^2(t)}{2})
$$

$$
+ \theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) (\frac{u_1^2(t) - \kappa_{ua}^2(t)}{2})
$$

$$
\Rightarrow \theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) (\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}) = \theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) (\frac{\kappa_{ua}^2(t) - u_1^2(t)}{2})
$$

$$
+ \theta_0 \left( \kappa_{va}(t) - \kappa_{ua}(t) \right) (\frac{\kappa_{va}^2(t) - u_1^2(t)}{2})
$$

and since $u_1(t)$ between $\kappa_{ua}(t)$ and $\kappa_{va}(t)$

$$
\theta_0 \left( \kappa_{ua}(t) - \kappa_{va}(t) \right) = \theta_0 \left( \kappa_{ua}(t) - u_1(t) \right)
$$

$$
\theta_0 \left( \kappa_{va}(t) - \kappa_{ua}(t) \right) = \theta_0 \left( \kappa_{va}(t) - u_1(t) \right)
$$

$$
\theta_0 \left( \kappa_{va}(t) - \kappa_{va}(t) \right) = \theta_0 \left( \kappa_{va}(t) - u_1(t) \right)
$$
then

\[ sg_0(\kappa_{ua}(t) - \kappa_{va}(t))\left(\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}\right) = \]

\[ sg_0(\kappa_{ua}(t) - u_1(t))\left(\frac{\kappa_{ua}^2(t) - u_1^2(t)}{2}\right) + sg_0(\kappa_{va}(t) - u_1(t))\left(\frac{\kappa_{va}^2(t) - u_1^2(t)}{2}\right) \]

according (4.6), we have

\[ sg_0(\kappa_{ua}(t) - \kappa_{va}(t))\left(\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}\right) = \]

\[ sg_0(\kappa_{ua}(t) - u_1(t))\left(\frac{\kappa_{ua}^2(t) - u_1^2(t)}{2}\right) + sg_0(\kappa_{va}(t) - u_1(t))\left(\frac{\kappa_{va}^2(t) - u_1^2(t)}{2}\right) \leq 0 \]

For \( k = \kappa_{ua}(t) \), we have

\[ sg_0(\kappa_{ua}(t) - \kappa_{va}(t))\left(\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}\right) = sg_0(\kappa_{va}(t) - \kappa_{ua}(t))\left(\frac{\kappa_{va}^2(t) - \kappa_{ua}^2(t)}{2}\right) \]

\[ = sg_0(\kappa_{va}(t) - u_1(t))\left(\frac{\kappa_{va}^2(t) - \kappa_{ua}^2(t)}{2}\right) \leq 0 \]

For \( k = \kappa_{va}(t) \), we have

\[ sg_0(\kappa_{ua}(t) - \kappa_{va}(t))\left(\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}\right) = sg_0(\kappa_{ua}(t) - u_1(t))\left(\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}\right) \leq 0. \]

It results

\[ sg_0(\kappa_{ua}(t) - \kappa_{va}(t))\left(\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}\right) \leq 0. \]

In the same way, from (4.8) and with similar choice of \( k \), we obtain

\[ sg_0(\kappa_{ub}(t) - \kappa_{vb}(t))\left(\frac{\kappa_{ub}^2(t) - \kappa_{vb}^2(t)}{2}\right) \geq 0. \]

Hence

\[ sg_0(\kappa_{ub}(t) - \kappa_{vb}(t))\left(\frac{\kappa_{ub}^2(t) - \kappa_{vb}^2(t)}{2}\right) - sg_0(\kappa_{ua}(t) - \kappa_{va}(t))\left(\frac{\kappa_{ua}^2(t) - \kappa_{va}^2(t)}{2}\right) \geq 0 \]

and then

\[ \int_0^T \int_a^b |v(x, t) - u(x, t)| \frac{\partial \theta(t)}{\partial t} dx dt \geq 0. \]
Existence and uniqueness of an entropy solution

Let \( t_0 \in ]0, T[ \), \( t_1 \in ]t_0, T[ \), \( \delta \in ]0, \frac{T - t_0}{2} [ \). Now we take a particular function \( \theta \) such that

\[
\theta(t) = \theta_\delta(t) = \begin{cases} 
> 0 & \text{if } t \in ]0, T[ \\
0 & \text{outside of } ]t_0, t_1[ \\
1 & \text{if } t \in ]t_0 + \delta, t_1 - \delta[ \\
\text{monotone if } t \in ]t_0, t_0 + \delta[ \text{ and } t \in ]t_1 - \delta, t_1[ 
\end{cases}
\]

retake

\[
\int_0^b \int_a^b |v(x, t) - u(x, t)| \frac{\partial \theta_\delta(t)}{\partial t} \, dx \, dt = \int_0^b \int_a^b |v(x, t) - u(x, t)| \frac{\partial \theta_\delta(t)}{\partial t} \, dx \, dt
\]

\[
= \int_a^b \left( |v(x, t) - u(x, t)| \theta_\delta(t) \right) |t_1 - t_0| \, dx - \int_0^b \int_a^b \frac{\partial |v(x, t) - u(x, t)|}{\partial t} \theta_\delta(t) \, dx \, dt.
\]

Since \( \theta_\delta(t_0) = \theta_\delta(t_1) = 0 \), then

\[
\int_{t_0}^{t_1} \int_a^b |v(x, t) - u(x, t)| \frac{\partial \theta_\delta(t)}{\partial t} \, dx \, dt = -\int_{t_0}^{t_1} \int_a^b \frac{\partial |v(x, t) - u(x, t)|}{\partial t} \theta_\delta(t) \, dx \, dt
\]

Taking a limit as \( \delta \to 0 \) yields

\[
\int_{t_0}^{t_1} \int_a^b |v(x, t) - u(x, t)| \frac{\partial \theta_\delta(t)}{\partial t} \, dx \, dt = -\int_{t_0}^{t_1} \int_a^b \frac{\partial |v(x, t) - u(x, t)|}{\partial t} \, dx \, dt
\]

\[
= -\int_a^b \left( |v(x, t) - u(x, t)| \right) |t_1 - t_0| \, dx
\]

\[
= \int_a^b |v(x, t_0) - u(x, t_0)| \, dx - \int_a^b |v(x, t_1) - u(x, t_1)| \, dx.
\]

Therefore

\[
\int_{t_0}^{t_1} \int_a^b |v(x, t) - u(x, t)| \frac{\partial \theta_\delta(t)}{\partial t} \, dx \, dt \geq 0
\]

\[
\Rightarrow \int_a^b |v(x, t_0) - u(x, t_0)| \, dx \geq \int_a^b |v(x, t_1) - u(x, t_1)| \, dx
\]
It remains to take a limit as \( t_0 \) tends to zero and to note \( t = t_1 \), to obtain, for almost any \( t \in ]0,T[ \),

\[
\int_a^b |v(x, t) - u(x, t)| \, dx \leq \int_a^b |\kappa_{v0}(x) - \kappa_{u0}(x)| \, dx
\]

where \( \kappa_{v0}(x) \) denotes a trace of \( v(x, t) \) at \( t = 0 \) and \( \kappa_{u0}(x) \) denotes a trace of \( u(x, t) \) at \( t = 0 \). It remains to verify that \( \kappa_{u0}(x) = u_0(x) = \kappa_{v0}(x) \) because \( u \) and \( v \) satisfy a same initial condition. We take inequality (4.5), a function \( \varphi \) of a form \( \varphi(x, t) = \theta_\delta(t)\rho(x) \) where \( \delta > 0, \theta_\delta(t) \in C^2([0, T]), \theta_\delta(0) = 1, \theta_\delta(t) \geq 0 \), decreasing and zero at \( t = \delta \), \( \rho(x) \in C^2([a, b]), \rho(x) \geq 0, \)

\[
\begin{aligned}
&\int_0^T \int_a^b (|u - k| \frac{\partial \theta_\delta(t)}{\partial t} \rho(x) + s g_0(u - k)((\frac{u^2 - k^2}{2})\theta_\delta(t) \frac{\partial \rho(x)}{\partial x} + f(x, t)\theta_\delta(t)\rho(x))) \, dx \, dt \\
&+ \int_a^b |u_0(x) - k| \rho(x) \, dx \\
&\geq \int_0^T \int_a^b (s g_0(u_2(t) - k)((\frac{u_2^2(t) - \kappa_{u0}(t)^2}{2})\theta_\delta(t)\rho(b)dt - \int_0^T \int_a^b (s g_0(u_1(t) - k)((\frac{u_1^2(t) - \kappa_{u0}(t)^2}{2})\theta_\delta(t)\rho(a)dt \\
&\Rightarrow \int_0^T \int_a^b (|u - k| \frac{\partial \theta_\delta(t)}{\partial t} \rho(x) + s g_0(u - k)((\frac{u^2 - k^2}{2})\theta_\delta(t) \frac{\partial \rho(x)}{\partial x} + f(x, t)\theta_\delta(t)\rho(x))) \, dx \, dt \\
&\geq - \int_a^b |u_0(x) - k| \rho(x) \, dx.
\end{aligned}
\]

Or

\[
\begin{aligned}
&\int_a^b \int_0^T |u - k| \rho(x) \frac{\partial \theta_\delta(t)}{\partial t} \, dt \, dx = \int_a^b \int_0^T |u - k| \rho(x) \frac{\partial \theta_\delta(t)}{\partial t} \, dt \, dx \\
&= \int_a^b (|u - k| \rho(x) \theta_\delta(t)) \bigg|_0^\delta \, dx - \int_a^b \int_0^\delta \frac{\partial |u - k| \rho(x)}{\partial t} \theta_\delta(t) \, dt \, dx. 
\end{aligned}
\]

Then

\[
\begin{aligned}
&\int_a^b \int_0^T |u - k| \rho(x) \frac{\partial \theta_\delta(t)}{\partial t} \, dt \, dx \bigg|_{\delta \to 0} \rightarrow \int_a^b |\kappa_{u0}(x) - k| \rho(x) \, dx
\end{aligned}
\]
and 
\[
\frac{T}{\delta} \int_a^b \int_0^1 \frac{u_2(t)-u_1(t)}{2} \theta_\delta(t) \frac{\partial \rho(x)}{\partial x} + f(x, t) \theta_\delta(t) \rho(x) dx dt \\
= \int_a^b \int_0^1 \frac{u_2(t)-u_1(t)}{2} \theta_\delta(t) \frac{\partial \rho(x)}{\partial x} + f(x, t) \theta_\delta(t) \rho(x) dx dt \\
\to 0.
\]

Hence
\[
\frac{T}{\delta} \int_a^b \int_0^1 \frac{u_2(t)-u_1(t)}{2} \theta_\delta(t) \theta_\delta(t) \rho(b) dt = \int_a^b \int_0^1 \frac{u_2(t)-u_1(t)}{2} \theta_\delta(t) \theta_\delta(t) \rho(b) dt \\
\to 0
\]
and
\[
\frac{T}{\delta} \int_a^b \int_0^1 \frac{u_2(t)-u_1(t)}{2} \theta_\delta(t) \theta_\delta(t) \rho(a) dt = \int_a^b \int_0^1 \frac{u_2(t)-u_1(t)}{2} \theta_\delta(t) \theta_\delta(t) \rho(a) dt \\
\to 0
\]

Taking limits as \( \delta \to 0 \), it holds that
\[
\forall k \in \mathbb{R}, \forall \rho(x) \in C^2([a, b]) : \int_a^b \left| \rho(x) - k \right| dx \\
\leq \int_a^b \left| \rho_0(x) - k \right| dx
\]
we deduce
\[
\forall k \in \mathbb{R} : \left| \rho_0(x) - k \right| \leq \left| \rho_0(x) - k \right| \\
\text{for almost any } x \in [a, b]
\]

Taking \( k > \max(\| \rho_0 \|_{L^\infty([a, b])}, | \rho_0 |_{L^\infty([a, b])}) \) and \( k < \min(| \rho_0 |_{L^\infty([a, b])}, | \rho_0 |_{L^\infty([a, b])}) \), we obtain \( \rho_0(x) = u_0(x) \) for almost any \( x \in [a, b] \), this concludes the proof of the theorem and the uniqueness of the entropy solution to problem (2.1) is proven.
