Abstract. With the help of the Fourier transform and of the method of the imaginary sources and imaginary scatterers is solved the problem of the scattering of the pulse sound signal by the elastic spheroidal shell, put in the plane waveguide.

Keywords: diffraction, waveguide, pulse, elastic spheroidal shell, source, scatterer, imaginary.

1. Introduction

At the basis of the method of the imaginary sources and imaginary scatterers is solved the problem of the scattering of the pulse signals of the elastic spheroidal shell, accommodated in the plane waveguide with the ideal boundary conditions. The impulse signals put the energy, therefore they are propagating with the group velocity, which lie in the principles of the method of the imaginary sources and imaginary scatterers.

2. The method of the imaginary sources and imaginary scatterers for the elastic spheroidal shell, put in the plane waveguide

The scattering of sound by the bodies, placed in the waveguide, are investigated in the papers [1, 2, 8, 9, 12-16]. In the paper [2] were calculated the
spectral characteristics of the idial spheroid, placed in the sound channel, by the pulse irradiation; in the papers [2] and [8] with the help of the method of the imaginary sources and scatterers are found the vertical distributions of the scattered sound field of the ideal soft spheroid, placed in the plane waveguide, at the irradiation his by the harmonic signal. In the article [6] with the help of the Fourier transform and characteristics of the stationary (continuous) sound signal are calculated the pulses, scattered by the ideal prolate spheroid.

Let’s put the elastic spheroidal shell into the liquid layer with the thickness \( H \) and the constant sound velocity. At the upper boundary of the waveguide is fulfilled Dirichlet condition, at the lower boundary – Neiman condition. The axis of the rotation of the prolate spheroidal shell will be orientated parallel to the boundaries of the waveguide and perpendicular to the plane of the Figure 1.

The dimensions of the scatterer, distance from it to the boundaries and the thickness of the waveguide \( H \) are supposed to be such that we can do without taking into consideration the scattering of the second order of the waves reflected from the boundaries of waveguide are not taken into account in the further process of the diffraction.

The centre of the scatterer is fixed at the distance \( z_1 \) from the bottom, at the horizontal distance \( R \) from it and on the depth \( H - z_0 \) (Fig. 1) is placed the point-source \( Q \) of the impulse sound signal. Using the method of the imaginary sources and scatterers [2, 8], are found the scattered pulse signal in the point \( Q \). The sound pulse signals were the two appearance: with the harmonic and frequency-modulated filling.

The spectrum \( S_0(2\pi\nu) \) of the sound pulse of the source \( \Psi(t) \) with the harmonic filling has the appearance [3]:

\[
S_0(2\pi\nu) = \frac{i\nu_0}{\pi(V_0^2 - \nu^2)}(-1)^n \sin(\pi n \frac{\nu}{\nu_0}),
\]

where: \( \nu_0 \) – the frequency of the filling of the impulse; \( n \) – the number of the oscillation periods of the harmonic signal in the pulse; \( \nu \) – the circular frequency.

The spectrum \( S_0(2\pi\nu) \) is connected with \( \Psi(t) \) by the return Fourier transform:

\[
\Psi(t) = (\pi)^{-1} \text{Re} \int_0^{\infty} S_0(2\pi\nu) \exp(i2\pi\nu)d(2\pi\nu)
\]

The spectrum of the reflected signal \( S_r(2\pi\nu) \) is by the product of the spectrum \( S_0(2\pi\nu) \) at the corresponding meanings of the angular characteristic of the scattering of the spheroidal shell \( D(\eta, \varphi, \nu) \) (\( \eta \) and \( \varphi \) – the angular coordinates of the point of the observation).

Let us consider the scatterer in the form of the elastic spheroidal shell (Fig. 2). All the potentials, including the plane wave potential \( \Phi_0 \), the scattered wave potential \( \Phi_1 \), the scalar shell potential \( \Phi_2 \), the Debye potentials \( U \) and \( V \) and the
potential $\Phi_i$ of the gas, filling the shell, can be expanded in the spheroidal wave functions [8]:

![Diagram](image)

Fig. 1. The mutual disposition of the pulse point-sources and scatterers in the plane waveguide.
\[ \Phi_0 = 2 \sum_{m=0}^{\infty} \sum_{n,m} i^{-n} e_{m} S_{m,n} (C_1, \eta_0) \tilde{S}_{m,n} (C_1, \eta) R_{m,n}^{(1)} (C_1, \xi) \cos m \varphi; \]

\[ \Phi_1 = 2 \sum_{m=0}^{\infty} \sum_{n,m} B_{m,n} S_{m,n} (C_1, \eta) R_{m,n}^{(1)} (C_1, \xi) \cos m \varphi; \]

\[ \Phi_2 = 2 \sum_{m=0}^{\infty} \sum_{n,m} S_{m,n} (C_1, \eta) \cos m \varphi \left[ C_{m,n} R_{m,n}^{(1)} (C_1, \xi) + D_{m,n} R_{m,n}^{(2)} (C_1, \xi) \right]; \]

\[ \Phi_3 = 2 \sum_{m=0}^{\infty} \sum_{n,m} E_{m,n} R_{m,n}^{(1)} (C_2, \xi) S_{m,n} (C_2, \eta) \cos m \varphi; \]

\[ U = 2 \sum_{m=0}^{\infty} \sum_{n,m} S_{m,n} (C_1, \eta) \sin m \varphi \left[ F_{m,n} R_{m,n}^{(1)} (C_1, \xi) + G_{m,n} R_{m,n}^{(2)} (C_1, \xi) \right]; \]

\[ V = 2 \sum_{m=0}^{\infty} \sum_{n,m} S_{m,n} (C_1, \eta) \cos m \varphi \left[ H_{m,n} R_{m,n}^{(1)} (C_1, \xi) + I_{m,n} R_{m,n}^{(2)} (C_1, \xi) \right]; \]

where:

\[ C_1 = k_1 h_0; \quad C_1 = k h_0, \quad k - \text{is the wavenumber of the sound wave in the gas, filling the shell}; \quad B_{m,n}, \quad C_{m,n}, \quad D_{m,n}, \quad E_{m,n}, \quad F_{m,n}, \quad G_{m,n}, \quad H_{m,n}, \quad I_{m,n} - \text{are unknown expansion coefficients.} \]

Fig. 2. The elastic spheroidal shell.

The expansion coefficients are determined from the physical boundary conditions preset at the two surfaces of the shell (\( \xi_0 \) and \( \xi_1 \), see Fig. 2) [8]:

\[ \text{Fig. 2. The elastic spheroidal shell.} \]
1) the continuity of the normal displacement component at both of the boundaries \( \xi_0 \) and \( \xi_1 \);

2) the identity between the normal stress in the elastic shell and the sound pressure in the liquid (\( \xi_0 \)) or in the gas (\( \xi_1 \));

3) the absence of the tangential stress at both of the shell boundaries \( \xi_0 \) and \( \xi_1 \).

The corresponding expressions for the boundary conditions have the form [8]

\[
\begin{align*}
(h_\xi)^{-1}(\partial \Phi_2 / \partial \xi) &= (h_\xi)^{-1}(\partial \Phi_2 / \partial \xi) + (h_\eta h_\phi)^{-1} \times \\
&\times [[(\partial / \partial \eta)(h_\eta \psi_\phi) - (\partial / \partial \phi)(h_\eta \psi_\eta)]\big]_{\xi=\xi} ;
\end{align*}
\]

\[
- \lambda_1 k_1^2 (\Phi_2 + \Phi_1) = - \lambda_1 k_2^2 \Phi_2 + 2 \mu_1 [(h_\xi h_\eta)^{-1} \times \\
&\times (\partial h_\xi / \partial \eta) u_\eta + (h_\xi)^{-1}(\partial u_\xi / \partial \xi)]\big]_{\xi=\xi_0} ;
\]

\[
- \lambda_2 k_2^2 \Phi_3 = - \lambda_1 k_3^2 \Phi_2 + 2 \mu_1 [(h_\xi h_\eta)^{-1} \times \\
&\times (\partial h_\xi / \partial \eta) u_\eta + (h_\xi)^{-1}(\partial u_\xi / \partial \xi)]\big]_{\xi=\xi_1} ;
\]

\[
O = (h_\eta/h_\xi)(\partial / \partial \xi)(u_\eta/h_\xi) + (h_\xi/h_\eta)(\partial / \partial \eta)(u_\xi/h_\xi)\big]_{\xi=\xi} ;
\]

\[
O = (h_\eta/h_\xi)(\partial / \partial \xi)(u_\eta/h_\xi) + (h_\xi/h_\eta)(\partial / \partial \eta)(u_\xi/h_\xi)\big]_{\xi=\xi_1} .
\]

Here \( \lambda_1 \) and \( \mu_1 \) are the Lame constants of the shell material; \( \lambda_0 \) is the bulk compression coefficient of the liquid; \( \lambda_2 \) is the bulk compression coefficient of the gas, filling the shell [8]:

\[
u_\xi = (h_\xi)^{-1}(\partial \Phi_2 / \partial \xi) + (h_\eta h_\phi)^{-1}[(\partial / \partial \eta)(h_\phi \psi_\eta) - (\partial / \partial \phi)(h_\eta \psi_\eta)];
\]

\[
u_\eta = (h_\eta)^{-1}(\partial \Phi_2 / \partial \eta) + (h_\xi h_\phi)^{-1}[\partial / \phi)(h_\xi \psi_\phi) - (\partial / \partial \xi)(h_\phi \psi_\phi)];
\]

\[
u_\phi = (h_\phi)^{-1}(\partial \Phi_2 / \partial \phi) + (h_\xi h_\eta)^{-1}[\partial / \xi)(h_\eta \psi_\eta) - (\partial / \partial \xi)(h_\phi \psi_\phi)].
\]

The substitution of the series (3) in the boundary conditions (4) yields the infinite
system of the equations for the determining the desired coefficients. Because of the orthogonality of the trigonometric functions \( \cos m\phi \) and \( \sin m\phi \), the infinite system of the equations breaks into infinite subsystems with fixed numbers \( m \). Each of the subsystems is solved by the truncations method. The number of the retained terms of the expansions (3) is the greater, the greater the wave size for the given potential

The angular characteristic of elastic spheroidal shell \( D(\eta, \phi) \) had calculated by the formula [8]:

\[
D(\eta, \phi) = (2/ik) \sum_{m=0}^{\infty} \sum_{n \in \mathbb{Z}} (-i)^n B_{m,n} S_{m,n}(C, \eta) \cos m\phi, \tag{5}
\]

where: \( C = kh_0 \) – the wave dimension, \( k \) – the wave number in liquid, \( h_0 \) – the half – focal distance; \( S_{m,n}(C, \eta) \) – the normalized angular spheroidal function; \( R^{(1)}_{m,n}(C, \xi_0) \) and \( R^{(3)}_{m,n}(C, \xi_0) \) – the radial spheroidal functions of the first and third forms correspondingly; \( \epsilon_m = 1(m = 0), 2(m \neq 0) \); \( \xi_0 \) – the radial coordinate of the scatterer; \( \eta_0 \) – the angular coordinate of the source.

Figure 2 shows the relative backscattering cross sections \( \sigma_0 \) for the different spheroidal bo-dies (ideal and elastic ones) and for the two angles of the irradiation \( (\theta_0 = 0^0 \text{ and } \theta_0 = 90^0) \). The Curve 1 corresponds to the steel prolate spheroidal shell, irradiated along the axis of the revolution \( Z(\theta_0 = 0^0) \). Curve 2 corresponds to the ideal soft spheroid with the same irradiation angle. Curve 3 represents the relative backscattering of the steel spheroid, irradiated at the angle \( \theta_0 = 90^0 \) (three – dimensional problem). Curve 4 corresponds to the rigid prolate spheroid: \( \xi_0 = 1,005, \theta_0 = 90^0 \); curve 5 is for the soft spheroid \( \xi_0 = 1,005, \theta_0 = 90^0 \). All the curves, shown in Fig. 3 represent functions of the wave size of the scatterers \( C = kh_0 \).
Fig. 3. The relative backscattering cross sections of prolate spheroidal bodies.

Acknowledgements

This worc supported as part of research under State Contract no P242 of April 21, 2010, within the Federal Target Program “Scientific and scientific – pedagogical personnel of innovative Russia for the years 2009 – 2013”.

3. Conclusions

In the paper is shown the effectiveness of the method of the imaginary sources and imaginary scatterers for the pulse sequence, got from spheroidal body and based at the use of the group velocity of the sound.
