Abstract

In this paper, we study the symmetry for the second kind generalized $q$-Euler numbers $E_{n,\chi,q}$ and polynomials $E_{n,\chi,q}(x)$. We obtain some interesting identities of the power odd sums and the second kind generalized polynomials $E_{n,\chi,q}(x)$ using the symmetric properties for the $p$-adic invariant integral on $\mathbb{Z}_p$.

Mathematics Subject Classification: 11B68, 11S40, 11S80

Keywords: The second kind generalized $q$-Euler numbers and polynomials, symmetric properties, power odd sums

1 Introduction

The area of the Bernoulli, Euler, Genocchi, and tangent polynomials have been studied by many authors. Those polynomials possess many interesting properties and are of great importance in pure mathematics, for example, number theory, mathematical analysis and in the calculus of finite differences. Those polynomials also have various applications in other branches of science(see [1-11]).

Throughout this paper we use the following notations. By $\mathbb{Z}_p$ we denote the ring of $p$-adic rational integers, $\mathbb{Q}$ denotes the field of rational numbers, $\mathbb{Q}_p$ denotes the field of $p$-adic rational numbers, $\mathbb{C}$ denotes the complex number field, and $\mathbb{C}_p$ denotes the completion of algebraic closure of $\mathbb{Q}_p$. Let $\nu_p$ be the
normalized exponential valuation of $\mathbb{C}_p$ with $|p|_p = p^{-\nu_p(q)} = p^{-1}$. When one talks of $q$-extension, $q$ is considered in many ways such as an indeterminate, a complex number $q \in \mathbb{C}$, or $p$-adic number $q \in \mathbb{C}_p$. If $q \in \mathbb{C}$ one normally assume that $|q| < 1$. If $q \in \mathbb{C}_p$, we normally assume that $|q - 1|_p < p^{-\frac{1}{p-1}}$ so that $q^x = \exp(x \log q)$ for $|x|_p \leq 1$.

Ryoo [10] introduced the second kind generalized $q$-Euler numbers $E_{n,\chi,q}$ and polynomials $E_{n,\chi,q}(x)$ attached to $\chi$. Let $\chi$ be Dirichlet’s character with conductor $d \in \mathbb{N}$ with $d \equiv 1(\text{mod } 2)$. The second kind generalized $q$-Euler numbers $E_{n,\chi,q}$ attached to $\chi$ are defined by the generating function:

$$2 \sum_{d=0}^{d-1} \chi(a)(-1)^a q^a e^{(2a+1)t} \frac{q^d e^{2dt}}{q^d e^{2dt} + 1} = \sum_{n=0}^{\infty} E_{n,\chi,q} \frac{t^n}{n!}. \quad (1.1)$$

We consider the second kind generalized $q$-Euler polynomials $E_{n,\chi,q}(x)$ attached to $\chi$ as follows:

$$2 \sum_{a=0}^{a-1} \chi(a)(-1)^a q^a e^{(2a+1)t} \frac{q^d e^{2dt}}{q^d e^{2dt} + 1} e^{xt} = \sum_{n=0}^{\infty} E_{n,\chi,q}(x) \frac{t^n}{n!}. \quad (1.2)$$

We recall that the second kind generalized $q$-Euler numbers $E_{n,\chi,q}$ and generalized $q$-Euler polynomials $E_{n,\chi,q}(x)$ are given by Ryoo [10]

$$E_{n,\chi,q}(x) = \int_X \chi(y)q^y (2y + 1 + x)^n d\mu_{-1}(y) \quad (1.3)$$

and

$$E_{n,\chi,q} = \int_X \chi(y)q^y (2y + 1)^n d\mu_{-1}(y) \quad (1.4)$$

respectively.

By (1.3) and (1.4), we have the following theorem.

**Theorem 1.1** For positive integers $n$, we have

$$E_{n,\chi,q}(x) = \sum_{l=0}^{n} \binom{n}{l} E_{l,\chi,q}. \quad (2)$$

### 2 Symmetry for the second kind generalized $q$-Euler polynomials

In this section, we assume that $q \in \mathbb{C}_p$. We obtain some interesting identities of the power odd sums and the second kind generalized polynomials $E_{n,\chi,q}(x)$.
using the symmetric properties for the $p$-adic invariant integral on $\mathbb{Z}_p$. If $n$ is odd, we obtain

$$\int_{\mathbb{Z}_p} g(x+n) d\mu_{-1}(x) + \int_{\mathbb{Z}_p} g(x) d\mu_{-1}(x) = 2 \sum_{k=0}^{n-1} (-1)^k g(k), \quad \text{(see [1, 4])}. \quad (2.1)$$

Substituting $g(x) = \chi(x) q^x e^{(2x+1)t}$ into the above, we obtain

$$\int_X \chi(x+n) q^{x+n} e^{(2(x+n)+1)t} d\mu_{-1}(x) + \int_X \chi(x) q^x e^{(2x+1)t} d\mu_{-1}(x)
\quad = 2 \sum_{j=0}^{n-1} (-1)^j \chi(j) q^j e^{(2j+1)t}. \quad (2.2)$$

For $k \in \mathbb{Z}_+$, let us define the power odd sums $T_{k,\chi,q}(n)$ as follows:

$$T_{k,\chi,q}(n) = \sum_{l=0}^{n} (-1)^l \chi(l) q^l (2l + 1)^k. \quad (2.3)$$

After some calculations, we have

$$\int_X \chi(x) q^x e^{(2x+1)t} d\mu_{-1}(x) = 2 \sum_{a=0}^{d-1} \chi(a)(-1)^a q^a e^{(2a+1)t},$$

$$\int_X \chi(x) q^{x+n} e^{(2(x+n)+1)t} d\mu_{-1}(x) = q^n e^{2nt} 2 \sum_{a=0}^{d-1} \chi(a)(-1)^a q^a e^{(2a+1)t}.$$ \quad (2.4)

By using (2.4), we have

$$\int_X \chi(x) q^{x+n} e^{(2(x+n)+1)t} d\mu_{-1}(x) + \int_X \chi(x) q^{x+nd} e^{(2(x+nd)+1)t} d\mu_{-1}(x)
\quad = (1 + q^{nd} e^{2ndt}) 2 \sum_{a=0}^{d-1} \chi(a)(-1)^a q^a e^{(2a+1)t}. \quad (2.5)$$

From the above, we have

$$\int_X \chi(x) q^{x+nd} e^{(2(x+nd)+1)t} d\mu_{-1}(x) + \int_X \chi(x) q^{x+nd} e^{(2x+1)t} d\mu_{-1}(x)
\quad = 2 \frac{\int_X \chi(x) q^{x+nd} e^{(2x+1)t} d\mu_{-1}(x)}{\int_X q^{ndx} e^{2ndtx} d\mu_{-1}(x).} \quad (2.5)$$

By substituting Taylor series of $e^{(2x+1)t}$ into (2.2), we obtain

$$\sum_{m=0}^{\infty} \left( \int_X \chi(x) q^{x+n} (2x+1+2nd)^m d\mu_{-1}(x) + \int_X \chi(x) q^{x} (2x+1)^m d\mu_{-1}(x) \right) \frac{t^m}{m!}$$

$$= \sum_{m=0}^{\infty} \left( 2 \sum_{j=0}^{nd-1} (-1)^j \chi(j) q^j (2j+1)^m \right) \frac{t^m}{m!}.$$
By comparing coefficients $\frac{t^n}{m!}$ in the above equation, we obtain

$$q^{nd} \sum_{k=0}^{m} \binom{m}{k} (2nd)^{m-k} \int_X \chi(x)q^x(2x + 1)^k d\mu_{-1}(x) = 2 \sum_{j=0}^{nd-1} (-1)^j \chi(j)q^j(2j + 1)^m$$

By using (2.3), we have

$$q^{nd} \sum_{k=0}^{m} \binom{m}{k} (2nd)^{m-k} \int_X \chi(x)q^x(2x + 1)^k d\mu_{-1}(x) + \int_X \chi(x)q^x(2x + 1)^m d\mu_{-1}(x) = 2T_{m,\chi, q}(nd - 1).$$

By using (2.5) and (2.6), we arrive at the following theorem:

**Theorem 2.1** Let $n$ be odd positive integer. Then we obtain

$$\frac{2 \int_X \chi(x)q^x e^{(2x+1)t} dt d\mu_{-1}(x)}{\int_X q^{ndx} e^{2ndxt} d\mu_{-1}(x)} = \sum_{m=0}^{\infty} \frac{(2T_{m,\chi, q}(nd - 1)) t^m}{m!}.$$  \hfill (2.7)

Let $w_1$ and $w_2$ be odd positive integers. Then we set

$$S(w_1, w_2) = \frac{\int_X \int_X \chi(x_1)\chi(x_2)q^{(w_1 x_1 + w_2 x_2)} e^{(w_1(2x_1 + 1) + w_2(2x_2 + 1) + w_1 w_2 x) t} d\mu_{-1}(x_1) d\mu_{-1}(x_2)}{\int_X q^{w_1 w_2 dx} e^{2w_1 w_2 dx} d\mu_{-1}(x)}.$$ \hfill (2.8)

By (2.7) and (2.8), after calculations, we obtain

$$S(w_1, w_2) = \left( \frac{1}{2} \int_X \chi(x_1)q^{w_1 x_1} e^{(w_1(2x_1 + 1) + w_1 w_2 x) t} d\mu_{-1}(x_1) \right) \times \left( \frac{2 \int_X \chi(x_2)q^{w_2 x_2} e^{(2x_2 + 1)(w_2 t)} d\mu_{-1}(x_2)}{\int_X q^{w_1 w_2 dx} e^{2w_1 w_2 dx} d\mu_{-1}(x)} \right)$$

$$= \left( \frac{1}{2} \sum_{m=0}^{\infty} E_{m,\chi, q^{w_1}}(w_2 x)w_1^m \frac{t^m}{m!} \right) \left( 2 \sum_{m=0}^{\infty} T_{m,\chi, q^{w_2}}(w_1 d - 1)w_2^m \frac{t^m}{m!} \right).$$ \hfill (2.9)

By using Cauchy product in the above, we have

$$S(w_1, w_2) = \sum_{m=0}^{\infty} \left( \sum_{j=0}^{m} \binom{m}{j} E_{j,\chi, q^{w_1}}(w_2 x) \frac{1}{w_1^j} T_{m-j,\chi, q^{w_2}}(w_1 d - 1)w_2^{m-j} \right) \frac{t^m}{m!}.$$ \hfill (2.10)
From the symmetry of $S(w_1, w_2)$ in $w_1$ and $w_2$, we also see that

$$S(w_1, w_2) = \left( \frac{1}{2} \int_X \chi(x) q^{w_2 x} e^{(w_2 (2x + 1) + w_1 x)} d\mu_1(x) \right) \times \left( 2 \int_X \chi(x) q^{w_2 x} e^{(2x + 1)(w_1 t)} d\mu_1(x) \right)$$

$$= \left( \frac{1}{2} \sum_{m=0}^{\infty} E_{m,\chi,q^2}(w_1 x) w_2^m \frac{t^m}{m!} \right) \left( 2 \sum_{m=0}^{\infty} T_{m,\chi,q^2}(w_2 d - 1) w_1^m \frac{t^m}{m!} \right).$$

Thus we have

$$S(w_1, w_2) = \sum_{m=0}^{\infty} \left( \sum_{j=0}^{m} \binom{m}{j} E_{j,\chi,q^2}(w_1 x) w_2^j T_{m-j,\chi,q^2}(w_2 d - 1) w_1^{m-j} \right) \frac{t^m}{m!}$$

(2.11)

By comparing coefficients $\frac{t^m}{m!}$ in the both sides of (2.10) and (2.11), we arrive at the following theorem:

**Theorem 2.2** Let $w_1$ and $w_2$ be odd positive integers. Then we obtain

$$\sum_{j=0}^{m} \binom{m}{j} w_1^{m-j} w_2^j E_{j,\chi,q^2}(w_1 x) T_{m-j,\chi,q^2}(w_2 d - 1) w_1^{m-j}$$

$$= \sum_{j=0}^{m} \binom{m}{j} w_1^j w_2^{m-j} E_{j,\chi,q^2}(w_2 x) T_{m-j,\chi,q^2}(w_1 d - 1),$$

where $E_{k,\chi,q^2}(x)$ and $T_{m,\chi,q^2}(k)$ denote the second kind generalized $q$-Euler polynomials and the alternating sums of powers of consecutive $q$-odd integers, respectively.

By Theorem 1.1, we have the following corollary.

**Corollary 2.3** Let $w_1$ and $w_2$ be odd positive integers. Then we obtain

$$\sum_{j=0}^{m} \sum_{k=0}^{j} \binom{m}{j} \binom{j}{k} w_1^{m-k} w_2^j x^{j-k} E_{k,\chi,q^2} T_{m-j,\chi,q^2}(w_2 d - 1)$$

$$= \sum_{j=0}^{m} \sum_{k=0}^{j} \binom{m}{j} \binom{j}{k} w_1^j w_2^{m-j} x^{j-k} E_{k,\chi,q^2} T_{m-j,\chi,q^2}(w_1 d - 1).$$

Now we will derive another interesting identities for the second kind generalized $q$-Euler polynomials using the symmetric property of $S(w_1, w_2)$.
By comparing coefficients in the both sides of (2.12) and (2.13), we have the following theorem.

By using the symmetry property in (2.12), we also obtain

\[ S(w_1, w_2) = \left( \frac{1}{2} \int_X \chi(x_1) q^{w_1 x_1} e^{(w_1 (2x_1 + 1) + w_2 x_2) t} d\mu_{-1}(x_1) \right) \]
\[ \times \left( \frac{2 \int_X \chi(x_2) q^{w_2 x_2} e^{(2x_2 + 1) (w_2 t)} d\mu_{-1}(x_2)}{\int_X q^{w_1 w_2 dx} e^{2w_1 w_2 dx} d\mu_{-1}(x)} \right) \]
\[ = \left( \frac{1}{2} e^{w_1 w_2 x t} \int_X \chi(x_1) q^{w_1 x_1} e^{(2x_1 + 1) w_1 t} d\mu_{-1}(x_1) \right) \]
\[ \times \left( 2 \sum_{j=0}^{w_1 d-1} (-1)^j \chi(j) q^{w_2 j} e^{(2j+1)(w_2 t)} \right) \]
\[ = \sum_{j=0}^{w_1 d-1} (-1)^j \chi(j) q^{w_2 j} \int_X \chi(x_1) q^{w_1 x_1} e^{(2x_1 + 1 + w_2 x + (2j+1) w_2/w_1) (w_1 t)} d\mu_{-1}(x_1) \]
\[ = \sum_{j=0}^{w_1 d-1} \left( \sum_{n=0}^\infty \left( (-1)^j \chi(j) q^{w_2 j} E_{n,1,q} \left( w_2 x + (2j + 1) \frac{w_2}{w_1} \right) \right) \frac{t^n}{n!} \right) \]

By using the symmetry property in (2.12), we also obtain

\[ S(w_1, w_2) = \left( \frac{1}{2} e^{w_1 w_2 x t} \int_X \chi(x_2) q^{w_2 x_2} e^{(2x_2 + 1) w_2 t} d\mu_{-1}(x_2) \right) \]
\[ \times \left( \frac{2 \int_X \chi(x_1) q^{w_1 x_1} e^{(2x_1 + 1) (w_1 t)} d\mu_{-1}(x_1)}{\int_X q^{w_1 w_2 dx} e^{2w_1 w_2 dx} d\mu_{-1}(x)} \right) \]
\[ = \left( \frac{1}{2} e^{w_1 w_2 x t} \int_X \chi(x_2) q^{w_2 x_2} e^{(2x_2 + 1) w_2 t} d\mu_{-1}(x_2) \right) \]
\[ \times \left( 2 \sum_{j=0}^{w_2 d-1} (-1)^j \chi(j) q^{w_1 j} e^{(2j+1)(w_1 t)} \right) \]
\[ = \sum_{j=0}^{w_2 d-1} (-1)^j \chi(j) q^{w_1 j} \int_X \chi(x_2) q^{w_2 x_2} e^{(2x_2 + 1 + w_1 x + (2j+1) w_1/w_2) (w_2 t)} d\mu_{-1}(x_1) \]
\[ = \sum_{n=0}^\infty \left( \sum_{j=0}^{w_2 - 1} (-1)^j \chi(j) q^{w_1 j} E_{n,1,q} \left( w_1 x + (2j + 1) \frac{w_1}{w_2} \right) \right) \frac{t^n}{n!} \]

By comparing coefficients \( \frac{t^n}{n!} \) in the both sides of (2.12) and (2.13), we have the following theorem.
Theorem 2.4 Let $w_1$ and $w_2$ be odd positive integers. Then we obtain
\[
\sum_{j=0}^{w_1d-1} (-1)^j \chi(j) q^{w_2j} E_{n,\chi,q}^{w_1} \left( w_2 x + (2j + 1) \frac{w_2}{w_1} \right) w_1^n = \sum_{j=0}^{w_2d-1} (-1)^j \chi(j) q^{w_1j} E_{n,\chi,q}^{w_2} \left( w_1 x + (2j + 1) \frac{w_1}{w_2} \right) w_2^n.
\] (2.14)

Observe that if $q \to 1$, then (2.14) reduces to Theorem 2.4 in [5].

If we take $x = 0$ in Theorem 2.4, we also derive the interesting identity for the second kind generalized $q$-Euler numbers as follows:
\[
\sum_{j=0}^{w_1d-1} (-1)^j \chi(j) q^{w_2j} E_{n,\chi,q}^{w_1} \left( (2j + 1) \frac{w_2}{w_1} \right) w_1^n = \sum_{j=0}^{w_2d-1} (-1)^j \chi(j) q^{w_1j} E_{n,\chi,q}^{w_2} \left( (2j + 1) \frac{w_1}{w_2} \right) w_2^n.
\]
