### Abstract

We introduce strongly  $\alpha g^*$ -closed set in bitopological spaces and some properties of these sets are investigated. Three bitopological spaces  $(i, j)_{-s^*}T_c$ ,  $(i, j)_{-s^*}T_g$  and  $(i, j)_{-s^*}T_{g^*}$  spaces are introduced as applications. A characterization for the topological space  $(i, j)_{-s^*}T_c$  is also introduced.

**Mathematics Subject Classification:** 54A10

**Keywords:**  $(i, j)$ - $\alpha g^*$ -closed sets,  $(i, j)_{-s^*}T_c$  space,  $(i, j)_{-s^*}T_{g^*}$  space and  $(i, j)_{-s^*}T_g$  space

### 1. INTRODUCTION

A triplet  $(X, \tau_1, \tau_2)$ , where  $X$  is a non-empty set and  $\tau_1$  and  $\tau_2$  are topologies on  $X$ , is called a bitopological space and Kelly [2] initiated the study of such spaces. In 1985, Fukutake [1] introduced the concepts of  $g$ -closed sets in bitopological spaces and after that several authors turned their attention towards generalizations of various concepts of topology by considering bitopological spaces. Sheik John and Sundaram [7] introduced  $g^*$ -closed sets and  $g^*$ -continuity in bitopological spaces in 2002.

Recently the authors introduced and studied  $\alpha g^*$ -closed sets [4] in topological spaces. In this paper we introduce the concepts of  $\alpha g^*$ -closed sets,  $s^*T_c$  space,  $s^*T_g$  spaces and  $s^*T_{g^*}$  space for bitopological spaces and investigate some of their properties.

## 2. PRELIMINARIES

If  $A$  is a subset of a topological space  $(X, \tau)$ , then the closure of  $A$  is denoted by  $\tau\text{-cl}(A)$  or  $\text{cl}(A)$ , the interior of  $A$  is denoted by  $\tau\text{-int}(A)$  or  $\text{int}(A)$  and the complement of  $A$  in  $X$  is denoted by  $A^c$ .

**Definition 2.1:** A subset  $A$  of a topological space  $(X, \tau)$  is called

- (i) an  $\alpha$ -open set [6] if  $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$  and an  $\alpha$ -closed set [5] if  $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ .
- (ii) a generalized closed set [3] (briefly  $g$ -closed set) if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- (iii) a generalized open set [3] (briefly  $g$ -open set) if  $A^c$  is  $g$ -closed in  $X$ .
- (iv) a  $g^*$ -closed set [8] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
- (v) a  $s\alpha g^*$ -closed set [4] if  $\alpha\text{Cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $X$ .
- (vi) a  $s\alpha g^*$ -open set [4] if  $A^c$  is a  $s\alpha g^*$ -closed set.

**Definition 2.2:** The class of all  $\alpha$ -open subsets of a space  $(X, \tau)$  is denoted by  $\tau^\alpha$ . The intersection of all  $\alpha$ -closed sets containing a subset  $A$  of  $(X, \tau)$  is called the  $\alpha$ -closure of  $A$  and is denoted by  $\alpha\text{cl}(A)$  or  $\tau\text{-}\alpha\text{cl}(A)$ .

Throughout this paper  $X$  and  $Y$  always represent non-empty bitopological spaces  $(X, \tau_1, \tau_2)$  and  $(Y, \sigma_1, \sigma_2)$  on which no separation axioms are assumed unless explicitly mentioned and the integers  $i, j, k \in \{1, 2\}$ . For a subset  $A$  of  $X$ ,  $\tau_i\text{-cl}(A)$  (resp.  $\tau_i\text{-int}(A)$ ,  $\tau_i\text{-}\alpha\text{cl}(A)$ ) denote the closure (resp. interior,  $\alpha$ -closure) of  $A$  with respect to the topology  $\tau_i$ . We denote the family of all  $g$ -open and  $g^*$ -open subsets of  $X$  with respect to the topology  $\tau_i$  by  $GO(X, \tau_i)$  and  $G^*O(X, \tau_i)$  respectively and the family of all  $\tau_j$ -closed sets is denoted by the symbol  $F_j$ . By  $(i, j)$  we mean the pair of topologies  $(\tau_i, \tau_j)$ .

**Definition 2.3:** A subset  $A$  of a topological space  $(X, \tau_1, \tau_2)$  is called

- (i)  $(i, j)$ - $g$ -closed [1] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U \in \tau_i$ .
- (ii)  $(i, j)$ - $g^*$ -closed set [7] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U \in GO(X, \tau_i)$

The family of all  $(i, j)$ - $g$ -closed (resp.  $(i, j)$ - $g^*$ -closed) subsets of a bitopological space  $(X, \tau_1, \tau_2)$  is denoted by  $D(i, j)$  (resp.  $D^*(i, j)$ ).

**Definition 2.4:** (i) A bitopological space  $(X, \tau_1, \tau_2)$  is said to be  $(i, j)$ - $T_{1/2}$  [1] if every  $(i, j)$   $g$ -closed set is  $\tau_j$ -closed.

(ii) A bitopological space  $(X, \tau_1, \tau_2)$  is said to be  $s$  pairwise  $T_{1/2}$  [1] if it is  $(1, 2)$ - $T_{1/2}$  and  $(2, 1)$ - $T_{1/2}$ .

(iii) A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ - $T_{1/2}^*$  space [7] if every  $(i, j)$ - $g^*$ -closed set is  $\tau_j$ -closed.

(iv) A bitopological space  $(X, \tau_1, \tau_2)$  is said to be a pairwise  $T^*_{1/2}$  space [7] if it is both  $(1, 2)$ - $T^*_{1/2}$  and  $(2, 1)$ - $T^*_{1/2}$ .

(v) A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ - $T^*_{1/2}$  space [7] if every  $(i, j)$ - $g$ -closed set is  $(i, j)$ - $g^*$ -closed .

### 3. $(i, j)$ -STRONGLY $\alpha g^*$ -CLOSED SETS

In this section we introduce the concept of  $(i, j)$ -strongly  $\alpha g^*$ -closed sets in bitopological spaces and discuss some of their properties.

**Definition 3.1:** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ -strongly  $\alpha g^*$ -closed (briefly  $(i, j)$ - $s\alpha g^*$ -closed) set if  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U \in G^*O(X, \tau_i)$ .

We denote the family of all  $(i, j)$ - $s\alpha g^*$ -closed sets in  $(X, \tau_1, \tau_2)$  by  $S^*(i, j)$ .

**Remark 3.2:** By setting  $\tau_1 = \tau_2$  in Definition 3.1, a  $(i, j)$ - $s\alpha g^*$ -closed set is a  $s\alpha g^*$ -closed set.

**Proposition 3.3:** If  $A$  is  $\tau_j$ -closed subset of  $(X, \tau_1, \tau_2)$  then  $A$  is  $(i, j)$ - $s\alpha g^*$ -closed set.

The converse of the above proposition is not true as seen from the following example.

**Example 3.4:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . Then the subset  $\{a, b\}$  is a  $(1, 2)$   $s\alpha g^*$ -closed set but not  $\tau_2$ -closed in  $(X, \tau_1, \tau_2)$ .

**Proposition 3.5:** If  $A$  is  $\tau_j$ - $g^*$ -closed subset of  $(X, \tau_1, \tau_2)$  then  $A$  is  $(i, j)$ -  $s\alpha g^*$ -closed set.

The converse of the above proposition is not true always. The subset  $\{a, b\}$  in Example 3.4 is  $(1, 2)$ - $s\alpha g^*$ -closed set but not  $\tau_2$ - $g^*$  closed set in  $(X, \tau_1, \tau_2)$

**Proposition 3.6:** If  $A$  is both  $\tau_j$ - $g^*$ -open and  $(i, j)$ - $s\alpha g^*$ -closed, then  $A$  is  $\tau_j$   $\alpha$ -closed.

**Proposition 3.7:** If  $A$  is  $(i, j)$ - $g^*$ -closed subset of  $(X, \tau_1, \tau_2)$  then  $A$  is  $(i, j)$ -  $s\alpha g^*$ -closed set.

The converse of the above proposition is not true always. The subset  $\{a, b\}$  in the above Example 3.4 is  $(1, 2)$ - $s\alpha g^*$ -closed set but not  $(1, 2)$ - $g^*$ -closed set in  $(X, \tau_1, \tau_2)$

**Proposition 3.8:** If  $A, B \in S^*(i, j)$  then  $A \cup B \in S^*(i, j)$ .

**Remark 3.9:** The intersection of two  $(i, j)$ - $\alpha g^*$ -closed sets need not be an  $(i, j)$ - $\alpha g^*$ -closed set as seen from the following example.

**Example 3.10:** If  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$  then  $\{a, b\}$  and  $\{a, c\}$  are  $(2,1)$ - $\alpha g^*$ -closed sets but  $\{a, b\} \cap \{a, c\} = \{a\}$  is not a  $(2,1)$ - $\alpha g^*$ -closed set.

**Remark 3.11:**  $S^*(1, 2)$  is generally not equal to  $S^*(2, 1)$ .

In Example 3.4,  $S^*(1, 2) = P(X)$  and  $S^*(2, 1) = P(X) - \{a\}$ . Therefore,  $S^*(2, 1) \neq S^*(1, 2)$

**Proposition 3.12:** If  $\tau_1 \subseteq \tau_2$  in  $(X, \tau_1, \tau_2)$  then  $S^*(2,1) \subseteq S^*(1,2)$ .

The converse of the above proposition is not true as seen from the following example.

**Example 3.13:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a, c\}, X\}$ . Then  $S^*(2, 1) \subseteq S^*(1, 2)$  but  $\tau_1$  is not contained in  $\tau_2$ .

**Proposition 3.14:** If  $A$  is  $(i, j)$ - $\alpha g^*$ -closed then  $\tau_j\text{-}\alpha\text{cl}(A) - A$  contains no non-empty  $\tau_i$ - $g^*$  closed set.

**Proof:** Let  $A$  be an  $(i, j)$ - $\alpha g^*$ -closed set and  $F$  be a non-empty  $\tau_i$ - $g^*$ -closed subset such that  $F \subseteq \tau_j\text{-}\alpha\text{cl}(A) - A = \tau_j\text{-}\alpha\text{cl}(A) \cap A^c$ . Therefore,  $F \subseteq \tau_j\text{-}\alpha\text{cl}(A)$  and  $F \subseteq A^c$ . Since  $F^c$  is a  $\tau_i$ - $g^*$ -open and  $A$  is  $(i, j)$ - $\alpha g^*$ -closed set in  $(X, \tau)$ , we have  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq F^c$ . That is,  $F \subseteq (\tau_j\text{-}\alpha\text{cl}(A))^c$ . Hence  $F \subseteq (\tau_j\text{-}\alpha\text{cl}(A) \cap (\tau_j\text{-}\alpha\text{cl}(A))^c = \phi$ . Therefore,  $\alpha\text{cl}(A) - A$  contains no non-empty  $\tau_j$ - $g^*$ -closed set.

The converse of the above proposition is not true as seen from the following example.

**Example 3.15:** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\phi, \{a\}, \{a, d\}, X\}$  and  $\tau_2 = \{\phi, X, \{a, b\}, \{c, d\}\}$ . If  $A = \{a\}$  then  $\tau_2\text{-}\alpha\text{cl}(A) - A = \{b\}$  does not contain any non-empty  $\tau_1$ - $g^*$ -closed set. But  $A$  is not a  $(1, 2)$ - $\alpha g^*$ -closed set.

**Corollary 3.16:** If  $A$  is  $(i, j)$ - $\alpha g^*$ -closed set in  $(X, \tau_1, \tau_2)$ , then  $A$  is  $\tau_j$ - $\alpha$ -closed if and only if  $\tau_j\text{-}\alpha\text{cl}(A) - A$  is  $\tau_i$ - $g^*$ -closed.

**Proof:** Necessity: If  $A$  is  $\tau_j$ - $\alpha$ -closed, then  $\tau_j\text{-}\alpha\text{cl}(A) = A$ . i.e.,  $\tau_j\text{-}\alpha\text{cl}(A) - A = \phi$  and hence  $\tau_j\text{-}\alpha\text{cl}(A) - A$  is  $\tau_i$ - $g^*$  closed.

Sufficiency: If  $\tau_j - \alpha \text{cl}(A) - A$  is  $\tau_j - g^*$ -closed then by Proposition 3.14,  $\tau_j - \alpha \text{cl}(A) - A = \phi$ , since  $A$  is  $(i, j) - \alpha g^*$ -closed set. Therefore,  $A$  is  $\tau_j - \alpha$ -closed.

**Proposition 3.17:** If  $A$  is an  $(i, j) - \alpha g^*$ -closed set of  $(X, \tau_i, \tau_j)$  such that  $A \subseteq B \subseteq \tau_j - \alpha \text{cl}(A)$ , then  $B$  is also an  $(i, j) - \alpha g^*$ -closed set of  $(X, \tau_i, \tau_j)$ .

**Proof:** Let  $U$  be a  $\tau_j - g^*$ -open set of  $(X, \tau_i, \tau_j)$  such that  $B \subseteq U$ . Then,  $A \subseteq U$ . Since  $A$  is a  $(i, j) - \alpha g^*$ -closed set,  $\tau_j - \alpha \text{cl}(A) \subseteq U$ . Also  $\tau_j - \alpha \text{cl}(B) \subseteq \tau_j - \alpha \text{cl}(\tau_j - \alpha \text{cl}(A)) = \tau_j - \alpha \text{cl}(A) \subseteq U$  which implies,  $\tau_j - \alpha \text{cl}(B) \subseteq U$ . Hence  $B$  is also an  $(i, j) - \alpha g^*$ -closed set of  $(X, \tau_i, \tau_j)$ .

**Proposition 3.18:** For each element  $x$  of  $(X, \tau_i, \tau_j)$ ,  $\{x\}$  is  $\tau_i - g^*$ -closed or  $\{x\}^c$  is  $(i, j) - \alpha g^*$ -closed.

**Proposition 3.19:** In a bitopological space  $(X, \tau_i, \tau_j)$  if  $G^*O(X, \tau_i) \subseteq F_j$  then every subset of  $X$  is an  $(i, j) - \alpha g^*$ -closed set of  $(X, \tau_i, \tau_j)$ .

**Proof:** Let  $G^*O(X, \tau_i) \subseteq F_j$ . Let  $A$  be a subset of  $X$  such that  $A \subseteq U$  where  $U \in G^*O(X, \tau_i)$ . Then  $\tau_j - \alpha \text{cl}(A) \subseteq \tau_j - \text{cl}(A) \subseteq \tau_j - \text{cl}(U) \subseteq U$  and hence  $A$  is an  $(i, j) - \alpha g^*$ -closed set of  $(X, \tau_i, \tau_j)$ .

#### 4. $(i, j) - s^*T_c, (i, j) - s^*T_g$ AND $(i, j) - s^*T_{g^*}$ SPACES

In this section, we introduce  $(i, j) - s^*T_c, (i, j) - s^*T_g$  and  $(i, j) - s^*T_{g^*}$  bitopological spaces and in Theorem 4.19 we prove that the  $(i, j) - s^*T_{g^*}$  space is the dual of the class of  $(i, j) - T^*_{1/2}$  space to the class of  $(i, j) - s^*T_c$  space.

**Definition 4.1:** A bitopological space  $(X, \tau_i, \tau_j)$  is said to be an  $(i, j) - s^*T_c$  space if every  $(i, j) - \alpha g^*$ -closed set is  $\tau_j$ -closed.

**Proposition 4.2:** If  $(X, \tau_i, \tau_j)$  is  $(i, j) - s^*T_c$  space, then it is an  $(i, j) - T^*_{1/2}$  space but not conversely.

**Example 4.3:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{ \phi, \{b\}, X \}$  and  $\tau_2 = \{ \phi, \{b\}, \{a, c\}, X \}$ . Then  $(X, \tau_1, \tau_2)$  is a  $(1, 2) - T^*_{1/2}$  space but not a  $(1, 2) - s^*T_c$  space.

**Theorem 4.4:** A bitopological space  $(X, \tau_i, \tau_j)$  is an  $(i, j) - s^*T_c$  space if and only if  $\{x\}$  is  $\tau_j$ -open or  $\tau_i - g^*$ -closed for each  $x \in X$ .

**Proof:** Suppose that  $\{x\}$  is not  $\tau_i - g^*$ -closed. Then by Proposition 3.18,  $\{x\}^c$  is  $(i, j) - s^* \alpha g^*$ -closed set. Since  $(X, \tau_i, \tau_j)$  is an  $(i, j) - s^*T_c$  space,  $\{x\}^c$  is  $\tau_j$ -closed. Therefore,  $\{x\}$  is  $\tau_j$ -open.

Conversely, let  $F$  be an  $(i, j) - \alpha g^*$ -closed set. By assumption,  $\{x\}$  is  $\tau_j$ -open or  $\tau_i - g^*$ -closed for  $x \in \tau_j - \alpha \text{cl}(F) \subseteq \tau_j - \text{cl}(F)$ .

Case (i) : Suppose  $\{x\}$  is  $\tau_j$ -open. Since  $\{x\} \cap F \neq \emptyset$ , we have  $x \in F$ .

Case (ii) : Suppose  $\{x\}$  is  $\tau_i$ - $g^*$ -closed. If  $x \notin F$ , then  $\{x\} \subseteq \tau_j\text{-}\alpha\text{cl}(F) - F$ , which is a contradiction to Proposition 3.14. Therefore,  $x \in F$ .

Thus in both cases, we conclude that  $F$  is  $\tau_j$ -closed. Hence  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $s^*T_c$  space.

**Remark 4.5:**  $(X, \tau_1)$  space is not generally a  $s^*T_c$  space, even if  $(X, \tau_1, \tau_2)$  is  $(1, 2)$ - $s^*T_c$  space as shown in the following Example 4.6. Also  $(X, \tau_1, \tau_2)$  is not generally a  $(1, 2)$ - $s^*T_c$  space even if both  $(X, \tau_1)$  and  $(X, \tau_2)$  are  $s^*T_c$  space. This is shown in Example 4.7.

**Example 4.6:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{b\}, \{b, c\}, X\}$  and  $\tau_2 = \{\emptyset, \{b\}, \{c\}, \{b, c\}, X\}$ . Then  $(X, \tau_1)$  is not a  $s^*T_c$  space but  $(X, \tau_1, \tau_2)$  is a  $(1, 2)$ - $s^*T_c$  space.

**Example 4.7:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{a, c\}, X\}$  and  $\tau_2 = \{\emptyset, \{a, b\}, X\}$ . Then both  $(X, \tau_1)$  and  $(X, \tau_2)$  are  $s^*T_c$  spaces but  $(X, \tau_1, \tau_2)$  is not a  $(1, 2)$ - $s^*T_c$  space.

**Definition 4.8:** A bitopological space  $(X, \tau_1, \tau_2)$  is said to be spairwise  $s^*T_c$  space if it is both  $(1, 2)$ - $s^*T_c$  and  $(2, 1)$ - $s^*T_c$  space.

**Proposition 4.9:** If  $(X, \tau_1, \tau_2)$  is spairwise  $s^*T_c$  space then it is spairwise  $T^{*1/2}$  space but not conversely.

**Example 4.10:** Let  $(X, \tau_1, \tau_2)$  be as in Example 4.3. Then,  $(X, \tau_1, \tau_2)$  is a spairwise  $T^{*1/2}$  space. But  $(X, \tau_1, \tau_2)$  is not a spairwise  $s^*T_c$  space since it is not a  $(2, 1)$ - $s^*T_c$  space.

We introduce the following definition.

**Definition 4.11:** A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ - $s^*T_g$  space if every  $(i, j)$ - $s\alpha g^*$ -closed is  $(i, j)$ - $g$ -closed set.

**Proposition 4.12:** Every  $(i, j)$ - $s^*T_c$  space is an  $(i, j)$ - $s^*T_g$  space but not conversely.

**Example 4.13:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{a, c\}, X\}$  and  $\tau_2 = \{\emptyset, \{a, b\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is a  $(2, 1)$ - $s^*T_g$  space but not a  $(2, 1)$ - $s^*T_c$  space.

**Proposition 4.14:** Every  $(i, j)$ - $s^*T_{g^*}$  space is an  $(i, j)$ - $s^*T_g$  space but not conversely.

**Example 4.15:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, X\}$  and  $\tau_2 = \{\emptyset, \{a, c\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is a  $(1, 2)$ - $s^*T_g$  space but not a  $(1, 2)$ - $s^*T_{g^*}$  space.

**Theorem 4.16:** A bitopological space  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_c$  space if and only if it is both  $(i, j)$ - $T_g$  space and  $(i, j)$ - $T^*_{1/2}$  space.

**Proof:** Suppose that  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_c$  space. Then by Proposition 4.2 and 4.12,  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T^*_{1/2}$  space and  $(i, j)$ - $T_g$  space.

Conversely, suppose  $(X, \tau_1, \tau_2)$  is both  $(i, j)$ - $T_g$  space and  $(i, j)$ - $T^*_{1/2}$  space. Let  $A$  be an  $(i, j)$ - $\alpha g^*$ -closed set of  $(X, \tau_1, \tau_2)$ . Since  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_g$  space,  $A$  is an  $(i, j)$ - $g$ -closed set. Since  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T^*_{1/2}$  space,  $A$  is  $\tau_j$ -closed set of  $(X, \tau_1, \tau_2)$ . Therefore,  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_c$  space.

We introduce the following definition.

**Definition 4.17:** A bitopological space  $(X, \tau_1, \tau_2)$  is said to be an  $(i, j)$ - $T_{g^*}$  space if every  $(i, j)$ - $\alpha g^*$ -closed set is an  $(i, j)$ - $g^*$ -closed set.

**Proposition 4.18:** Every  $(i, j)$ - $T_c$  space is an  $(i, j)$ - $T_{g^*}$  space but not conversely.

Let  $(X, \tau_1, \tau_2)$  be as in Example 4.3. Then,  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_{g^*}$  space but not a  $(1, 2)$ - $T_c$  space.

**Theorem 4.19:** A bitopological space  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_c$  space if and only if it is both  $(i, j)$ - $T_{g^*}$  space and  $(i, j)$ - $T^*_{1/2}$  space.

**Proof:** Suppose that  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_c$  space. Then by Proposition 4.2 and 4.18,  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T^*_{1/2}$  space and  $(i, j)$ - $T_{g^*}$  space.

Conversely, suppose that  $(X, \tau_1, \tau_2)$  is both  $(i, j)$ - $T^*_{1/2}$  space and  $(i, j)$ - $T_{g^*}$  space. Let  $A$  be an  $(i, j)$ - $\alpha g^*$ -closed set of  $(X, \tau_1, \tau_2)$ . Since  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_{g^*}$  space,  $A$  is an  $(i, j)$ - $g^*$  closed set. Since  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T^*_{1/2}$  space,  $A$  is  $\tau_j$ -closed set of  $(X, \tau_1, \tau_2)$ . Therefore,  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_c$  space.

**Remark 4.20:**  $(i, j)$ - $T^*_{1/2}$  and  $(i, j)$ - $T_{g^*}$  spaces are independent as seen from the following two examples.

**Example 4.21:** Let  $X, \tau_1$  and  $\tau_2$  be as in Example 4.3. Then  $(X, \tau_1, \tau_2)$  is a  $(i, j)$ - $T^*_{1/2}$  space but it is not an  $(i, j)$ - $T_{g^*}$  space.

**Example 4.22:** Let  $X, \tau_1$  and  $\tau_2$  be as in Example 4.13. Then  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $T_{g^*}$  space but it is not an  $(i, j)$ - $T^*_{1/2}$  space.

**Remark 4.23:** In an  $(i, j)$ - $T_{g^*}$  space  $(X, \tau_1, \tau_2)$ , the converse of the Theorem 3.19 is true.

**Remark 4.24:**  $(i, j)$ - $T^*_{1/2}$  and  $(i, j)$ - $T_g$  spaces are independent as seen from the following two examples.

**Example 4.25:** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{a, d\}, X\}$  and  $\tau_2 = \{\emptyset, \{a, b\}, \{c, d\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is a  $(2, 1)$ -  $T^*_{1/2}$  space but not a  $(2, 1)$ - $_{s^*}T_g$  space. Also,  $(X, \tau_1, \tau_2)$  is a  $(1, 2)$ - $_{s^*}T_g$  space but not a  $(1, 2)$ -  $T^*_{1/2}$  space.

**Remark 4.26:**  $(i, j)$ - $T_{1/2}$  and  $(i, j)$ - $_{s^*}T_g$  spaces are independent as seen from the following two examples.

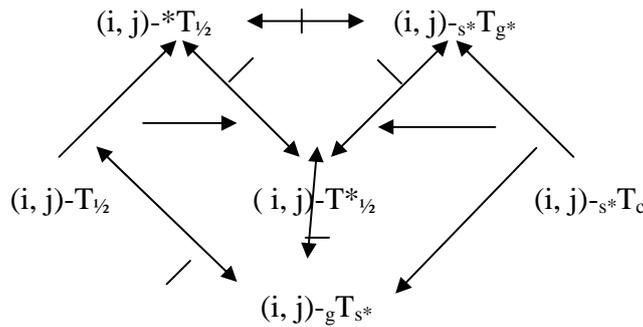

**Example 4.27:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{a, c\}, X\}$  and  $\tau_2 = \{\emptyset, \{a, b\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is a  $(2, 1)$ - $_{s^*}T_g$  space but not a  $(2, 1)$ - $T_{1/2}$  space.

**Example 4.28:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, X\}$  and  $\tau_2 = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is a  $(2, 1)$ -  $T_{1/2}$  space but not a  $(2, 1)$ - $_{s^*}T_g$  space.

**Remark 4.29:**  $(i, j)$ - $T^*_{1/2}$  and  $(i, j)$ - $_{s^*}T_{g^*}$  spaces are independent as seen from the following two examples.

**Example 4.30:** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, X\}$  and  $\tau_2 = \{\emptyset, \{a\}, \{b, c\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is a  $(1, 2)$ - $T_{1/2}$  space but not a  $(1, 2)$ - $_{s^*}T_{g^*}$  space. Also, the bitopological space  $(X, \tau_1, \tau_2)$  in Example 4.27 is a  $(1, 2)$ - $_{s^*}T_{g^*}$  space but not a  $(1, 2)$ -  $T_{1/2}$  space

**Remark 4.31:** From the above discussions and known results we have the following diagram:

(Where  $A \rightarrow B$  (resp.  $A \longleftrightarrow B$ ) represents  $A$  implies  $B$  but not conversely (resp.  $A$  and  $B$  are independent))
