### Abstract

In this paper mildly-regular topological space was introduced via the concept of mildly  $g$ -open sets. Many properties of mildly - regular space are investigated and the interactions between mildly-regular space and certain types of topological spaces are considered. Also the concept of strong mildly-regular space was introduced and a main theorem on this space was proved.

**Keywords:**  $g$ -closed set, mildly closed set, mildly closure of set, mildly Hausdorff space, irresolute function,  $M$ -open function

### 1. Introduction and Preliminaries

Throughout this paper  $X$  is topological space and no separation axioms are assumed. For a subset  $A$  of a space  $X$  the symbols of closure, interior and the complement of  $A$  with respect to a topological space  $(X, \tau)$  will be denoted by  $cl A$ ,  $int A$  and  $A^c$ , respectively. By  $cl_{\tau_A}(B)$  and  $int_{\tau_A}(B)$  we mean the closure and the interior operators for a subset  $B$  with respect to the relative topology  $\tau_A$  on a subspace  $(A, \tau_A)$  of a topological space  $(X, \tau_X)$ . The concept of generalized closed set introduced by Levine [1], recall that a subset  $A$  of a space  $X$  is called  $g$ -closed if  $cl(A)$  subset of every open set in  $X$  containing  $A$ . the complement of  $g$ -closed set is called  $g$ -open. In 2004 J. K. Park and J. H. Park [4] introduce the concept of mildly closed set and this concept was developed by P.G. Palanimani and R.parimelazhagan [2, 3]. A subset  $A$  of a space  $X$  is called mildly closed set if  $cl(int(A)) \subset U$ , whenever  $A \subset U$  and  $U$  is  $g$ -open, the complement of mildly closed set is called mildly open.

## 2. Mildly - regular space

Beginning this section with the definition of mildly-regular space.

**Definition 2.1.** A space  $X$  is called mildly-regular if for each  $a \in X$  and every closed set  $F$  in  $X$  such that  $a \notin F$ , there exists disjoint mildly open sets  $U$  and  $V$  in  $X$  such that  $F \subset U$ ,  $a \in V$ .

Now we will show that the mildly open set in any space still mildly open in any closed subspace but before that we need following lemma.

**Lemma 2.2.** [1] Let  $(A, \tau_A)$  be a subspace of space  $X$  and suppose  $B$  be a subset of  $A$  such that  $B$  is a  $g$ -closed set relative to  $\tau_A$  and  $A$  is a  $g$ -closed subset of  $X$ . Then  $B$  is  $g$ -closed relative to  $X$ .

**Theorem 2.3.** Let  $(A, \tau_A)$  be a closed subspace of a space  $X$  then every mildly open set of  $X$  is mildly open set relative to  $\tau_A$ .

**Proof.** Let  $B \subset A \subset X$ , such that  $A$  is closed in  $X$  and  $B$  is mildly open in  $X$ . .By duality of definition of mildly closed, a set  $B$  is mildly open in  $X$  if and only if for each  $g$ -closed set  $F$  in  $X$  such that  $F \subset B$  then  $F \subset \text{int}(\text{cl}(B))$ . Let  $G \subset B$  and  $G$  is  $g$ -closed set relative to  $\tau_A$ , since  $A$  is closed then  $A$  is  $g$ -closed so by lemma 2.2.  $G$  is  $g$ -closed relative to  $X$ , but  $B$  is mildly open relative to  $X$ , hence  $G \subset \text{int}_{\tau_X}(\text{cl}_{\tau_X}(B)) \subset \text{int}_{\tau_X}(\text{cl}_{\tau_X}(B)) \cap A \subset \text{int}_{\tau_A}(\text{cl}_{\tau_X}(B)) \subset \text{int}_{\tau_A}(\text{cl}_{\tau_X}(B \cap A)) \subset \text{int}_{\tau_A}((\text{cl}_{\tau_X}(B) \cap \text{cl}_{\tau_X}(A)) \subset \text{int}_{\tau_A}((\text{cl}_{\tau_X}(B) \cap (A)) \subset \text{int}_{\tau_A}(\text{cl}_{\tau_A}(B))$  and this complete the proof.

**Definition 2.4.** [5] The mildly closure of a set  $A$ , denoted by  $\text{mcl}(A)$ , is the intersection of all mildly closed sets containing  $A$ .

In the following theorems we give a characterization of mildly-regular space.

**Theorem 2.5.** A topological space  $X$  is mildly-regular if and only if for every  $x \in X$  and every open set  $U$  such that  $x \in U$ , there exists a mildly open set  $V$  such that  $x \in V \subset \text{mcl}(V) \subset U$ .

**Proof.** Suppose  $X$  is mildly regular and  $U$  an open set containing  $x \in X$ . Thus  $x \notin U^c$  so there exist disjoint mildly open sets  $V$  and  $W$  containing  $x$  and  $U^c$  respectively, also  $V \subset W^c$  and  $W^c$  is mildly closed hence  $\text{mcl}(V) \subset \text{mcl}(W^c)$  and hence  $\text{mcl}(V) \subset W^c \subset U$ , then we have  $x \in V \subset \text{mcl}(V) \subset U$ . For sufficiency let  $x \notin F$  where  $F$  is closed set in  $X$  then  $x \in F^c$  and  $F^c$  is open, so there exist mildly  $g$ -open set  $V$  such that  $x \in V \subset \text{mcl}(V) \subset F^c$  implies  $F \subset (\text{mcl}(V))^c$  and  $(\text{mcl}(V))^c$  is mildly  $g$ -open set. But  $V \cap (\text{mcl}(V))^c = \emptyset$  hence  $x \in V$ ,  $F \subset (\text{mcl}(V))^c$  and we have done.

**Theorem 2.6.** A topological space  $X$  is a mildly-regular space if and only if for every  $x \in X$  and every open set  $V$  belong to finite base  $B$  such that  $x \in V$ , there exists a mildly open set  $U$  such that  $x \in U$  and  $\text{cl}(\text{int}(U)) \subset V$ .

**Proof.** Since  $x \notin V^c$  and  $V^c$  closed, so there exist disjoint mildly open sets  $U_1, U_2$  such that  $x \in U_1$  and  $V^c \subset U_2$  then we have  $U_1 \subset (U_2)^c \subset V$ . Furthermore,  $(U_2)^c$  is mildly closed set and  $V$  is open set so  $V$  is g-open set, then by definition of mildly closed set we have that  $\text{cl}(\text{int}(U_1)) \subset \text{cl}(\text{int}(U_2)^c) \subset V$ . For sufficiency let  $x \in X$  and  $F$  be a closed subset of  $X$  such that  $x \notin F$  and suppose  $V_1, V_2, \dots, V_k \in B$  such that  $x \in \bigcap_{i=1}^k V_i \subset F^c$ . Thus there exist a mildly open set  $U_i$  such that  $x \in U_i$  and  $\text{cl}(\text{int}(U_i)) \subset V_i$  for  $i=1, 2, \dots, k$ . Then the mildly open sets  $U_1 = \bigcap_{i=1}^k V_i$  and  $U_2 = (\bigcap_{i=1}^k \text{cl}(\text{int}(U_i)))^c$  are disjoint such that  $x \in U_1$  and  $F \subset (\bigcap_{i=1}^k V_i)^c \subset (\bigcap_{i=1}^k \text{cl}(\text{int}(U_i)))^c = U_2$

**Definition 2.7.** A space  $X$  is called weakly mildly- Hausdorff if for each distinct points  $x, y \in X$  such that  $x \notin \text{cl}(V_y)$  where  $V_y$  any mildly open set containing  $y$  then there exist a disjoint mildly open sets  $V, W$  containing  $x$  and  $y$  respectively.

**Proposition 2.8.** Every mildly regular topological space is weakly mildly- Hausdorff.

**Proof.** Let  $X$  be a mildly regular space and let  $x, y$  be any distinct points in  $X$  suppose  $x \notin \text{cl}(V_y)$  where  $V_y$  be any mildly open set containing  $x$ . Now since  $X$  is mildly regular then there exist disjoint mildly open sets  $U_x$  and  $U_y$  such that  $x \in U_x$  and  $y \in \text{cl}(V_y) \subset U_y$  implies  $X$  is weakly Hausdorff space. If  $y \notin \text{cl}(V_x)$  the proof is similar.

**Definition 2.9.** [7] A space  $X$  is called mildly- Hausdorff if for each distinct points  $x, y \in X$  there exist two disjoint mildly-open sets  $U_x$  and  $U_y$  containing  $x$  and  $y$  respectively.

The following example showed that the quotient topology of the mildly regular space can be mildly Hausdorff space.

**Example 2.10.** Let  $X$  be mildly regular space and  $F$  be a closed subset of  $X$ . Define a relation on  $X$  as follow,  $x \mathcal{R} y$  if and only if either  $x, y$  in  $F$  or if  $x, y \notin F$  then  $x=y$ . We can see that  $\mathcal{R}$  is an equivalents relation, to prove that  $X/\mathcal{R}$  with the quotient topology is mildly Hausdorff space take  $[x], [y]$  in  $X/\mathcal{R}$  such that  $[x] \neq [y]$ , in this case we can see that either  $x$  or  $y$  belong to  $F$  and the other may not so let  $x$  in  $F$  and  $y \notin F$ , but  $F$  is closed in the mildly regular space  $X$  then there exists disjoint mildly open sets  $U$  and  $V$  such that  $[x] \subset F \subset U$  and  $[y] \subset V$  therefore  $X$  is mildly Hausdorff space.

In the following example we show that the quotient space of mildly regular space need not be mildly regular.

**Example 2.11.** Take the real line with usual topology and let  $P: \mathbb{R} \rightarrow A$ , where  $A = \{a, b, c\}$  defined as follow:

$$P(x) = \begin{cases} a & \text{if } x > 0 \\ b & \text{if } x < 0 \\ c & \text{if } x = 0 \end{cases}$$

Then the quotient topology on  $A$  will be  $T = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$  and  $A$  with the topology  $T$  is not mildly regular space but  $\mathbb{R}$  with usual topology is mildly regular.

**Definition 2.12.** [5] A function  $f: X \rightarrow Y$  is called mildly irresolute if the inverse image of each mildly open set in  $Y$  is mildly open set in  $X$ .

The following proposition showed that the property of mildly regular space invers preserving under injective closed mildly irresolute function

**Proposition 2.13.** Let  $f: X \rightarrow Y$  be a closed mildly irresolute injective function and  $Y$  is mildly regular space then  $X$  is mildly regular space.

**Proof.** Let  $x$  be a point in  $X$  and  $A$  be any closed subset of  $X$  such that  $x \notin A$ , then  $f(A)$  is closed in a space  $Y$  such that  $f(x) \notin f(A)$  and by mildly regularity of  $Y$  there exists disjoint mildly-open sets  $U, V$  such that  $f(A) \subset U$  and  $f(x) \in V$ . Clear that  $A \subset f^{-1}(f(A)) \subset f^{-1}(U)$  and  $x \in f^{-1}(V)$  also  $f^{-1}(U) \cap f^{-1}(V) = \emptyset$  for instance see [6], but  $f$  is mildly irresolute implies  $f^{-1}(U), f^{-1}(V)$  are mildly open subsets of  $X$  which complete the proof.

**Definition 2.14.** [7] A function  $f: X \rightarrow Y$  is called  $M$ -open if the image of each mildly-open set in  $X$  is mildly open set in  $Y$ .

**Proposition 2.15.** Let  $f: X \rightarrow Y$  be a bijective,  $M$ -open and continuous function and  $X$  is mildly regular space then  $Y$  is mildly-regular space.

**Proof.** Let  $B$  be a closed set in  $Y$  and  $y \notin B$ , then  $f^{-1}(B) \subset X$  and  $f^{-1}(y) \notin f^{-1}(B)$ . Now  $f^{-1}(B)$  is closed in  $X$ ,  $X$  is mildly regular space then there exists disjoint mildly open sets  $U$  and  $V$  such that  $f^{-1}(B) \subset U$  and  $f^{-1}(y) \in V$ , but  $f$  is  $M$ -open then it is very easy to see that  $f(U)$  and  $f(V)$  are disjoint mildly open sets in  $Y$  containing  $B$  and  $y$  respectively.

### 3. Strongly mildly regular

**Definition 3.1.** A space is called strong mildly-regular space if for any  $y \notin M$ ,  $M$  mildly closed there exist two disjoint open sets  $U$  and  $V$  such that  $y \in U$  and  $M \subset V$ . It is very easy to see that every strong mildly-regular is mildly-regular. The following example showed that the converses need not necessarily true.

**Example 3.2.** The space  $X = \{a, b, c\}$  with topology  $T = \{X, \phi, \{a\}, \{b, c\}\}$  is mildly-regular but not strong mildly-regular. We can characterize strongly mildly regular space as follows:

**Theorem.3.3.** Let  $X$  be a topological space then the following are equivalent:

- (1)  $X$  is strongly mildly regular
- (2) for each  $y \in U$ ,  $U$  is mildly open, there exist open set  $V$  such that  $y \in V \subset \text{cl}(V) \subset U$
- (3) For each  $y \in X$  and mildly closed set  $U$ , such that  $y \notin U$ , there exist an open set  $V$  such that  $y \in V$  and  $\text{cl}(V) \subset U^c$ .

**Proof.** (1)  $\rightarrow$  (2) since  $y \notin U^c$  and  $U^c$  is mildly closed then there exist  $V$  and  $W$  such that  $y \in V$  and  $U^c \subset W$  where  $W$  and  $V$  are disjoint open sets and it is very easy to see that  $\text{cl}(V) \subset W^c$  hence  $\text{cl}(V) \cap U^c \subset \text{cl}(V) \cap W = \phi$  and hence  $\text{cl}(V) \subset U$ .

(2)  $\rightarrow$  (3) We can apply (2) on  $y$  and  $U^c$  to find open set  $V$  such that  $y \in V \subset \text{cl}(V) \subset U^c$

(3)  $\rightarrow$  (1) let  $y$  be any point in  $X$  and  $U$  any mildly closed subset of  $X$  such that  $y \notin U$ , then we can find two disjoint open sets  $V$  and  $(\text{cl}(V))^c$  such that  $y \in V$  and  $U \subset (\text{cl}(V))^c$ .

**Definition3.4.** [7] A function  $f: X \rightarrow Y$  is said to be  $M$ - closed if the image of mildly closed set in  $X$  is mildly closed in  $Y$ .

In the following theorem we can apply proposition 2.13 to show that the strongly mildly regular property invers preserved under continuous  $M$ -closed function

**Theorem 3.5.** If  $f: X \rightarrow Y$  injective, continuous,  $M$ - closed function and  $Y$  is strongly mildly regular then  $X$  is strongly mildly regular.

**Proof.** Let  $A$  be a mildly closed subset of a topological space  $X$  and let  $x$  be any point belong to  $X$  and  $x \notin A$ , then  $f(A)$  is mildly closed set and  $f(x) \notin f(A)$ , but  $Y$  is strongly mildly regular so there exist disjoint open sets  $U, V$  in  $Y$  such that  $f(x) \in U$  and  $f(A) \subset V$ , but  $A \subset f^{-1}(f(A)) \subset f^{-1}(V)$  and  $x \in f^{-1}(U)$  hence  $f^{-1}(U), f^{-1}(V)$  are disjoint open sets containing  $x$  and  $A$  respectively. Thus  $X$  is strongly mildly regular.

**Lemma 3.6.**[5] Suppose that  $B \subset A \subset X$ , and  $B$  is mildly closed set relative to  $A$  and  $A$  is  $g$ -open and mildly closed set relative to  $X$ , then  $B$  is mildly closed relative to  $X$ .

The following theorem showed that the property of being strongly mildly regular space is hereditary under some conditions

**Theorem 3.7.** Let  $X$  be a mildly regular space and  $A$  be a  $g$ -open and mildly closed subspace of  $X$  then  $A$  is mildly regular space.

**Proof.** Let  $F_A$  be a mildly closed set relative to  $A$  and  $x \in A$  such that  $x \notin F_A$ . By the above lemma  $F_A$  is mildly closed set relative to  $X$  so there exist disjoint open sets  $U, V$  such that  $y \in V$  and  $F_A \subset U$ . Now it is clear that  $A \cap U$  and  $A \cap V$  are disjoint open sets relative to  $A$  containing  $F_A$  and  $x$  respectively.
